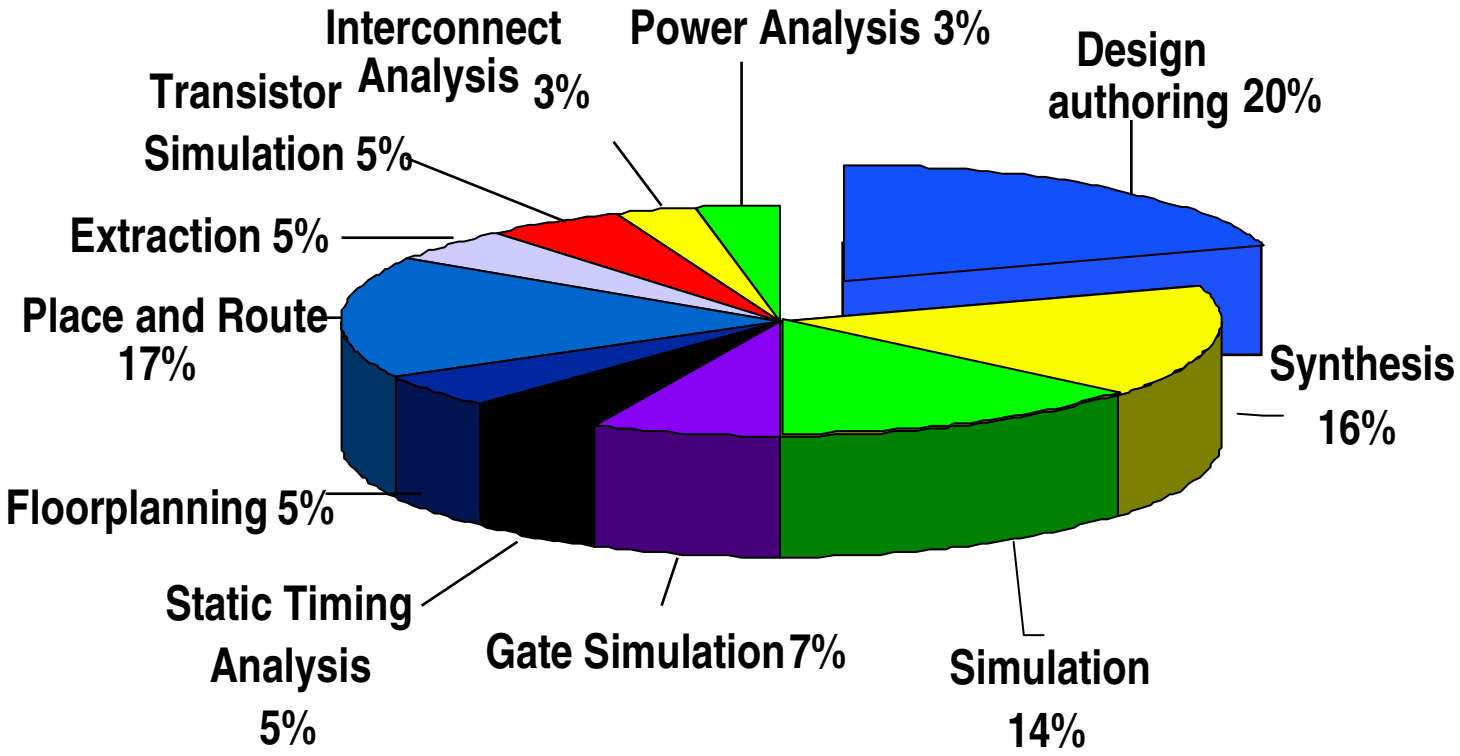
FPGA Sweats the Details

- Xilinx programmable system platform gives designers the benefits of deep submicron
- Rather than focusing on getting the silicon to work, you can focus on getting the design to work

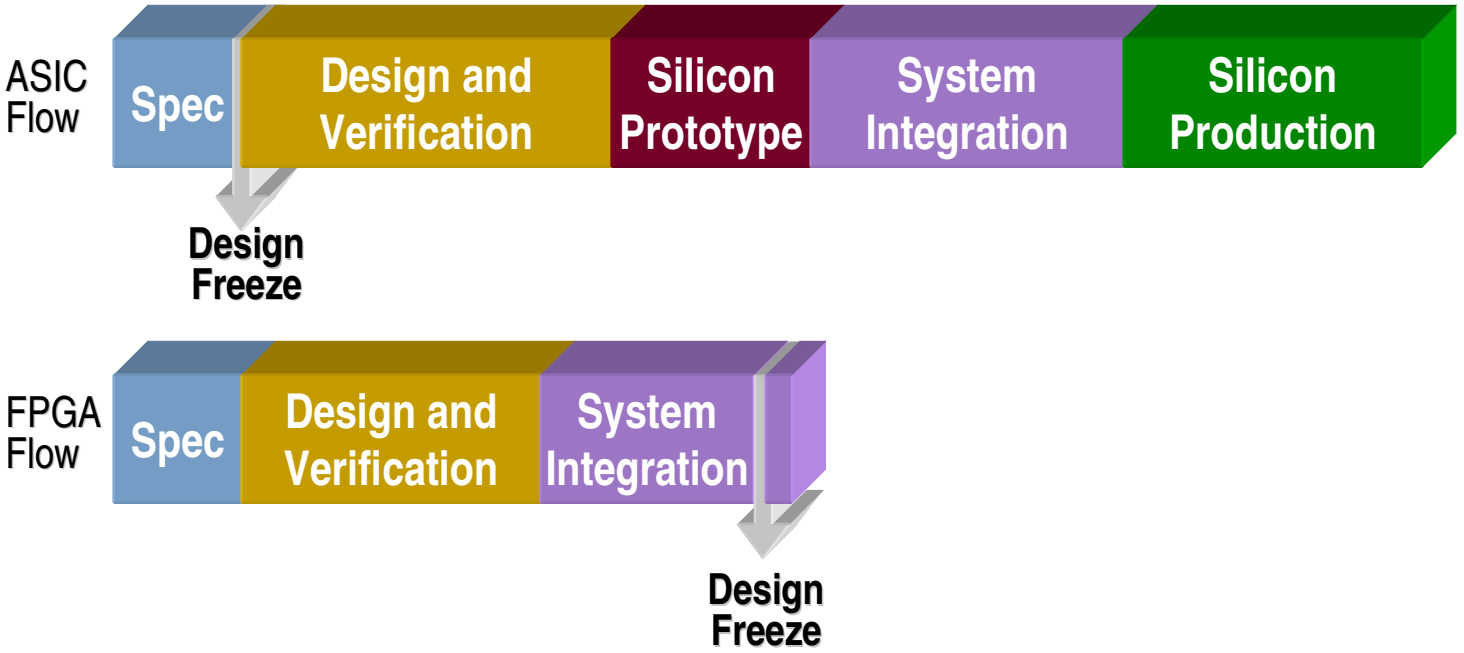
Complex ASIC Design
The Shrinking Window of Innovation



- Average iterations between design and layout = 20

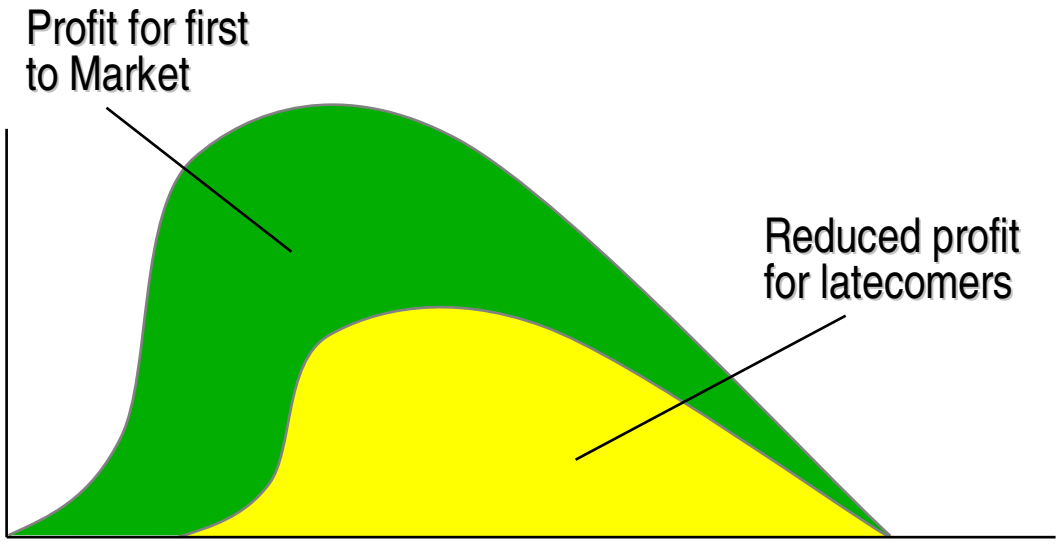
(Source Electronic Systems Jan 99)

Simpler/Faster Design Flows



- 2:1 proven Time-to-Market Advantage
- No silicon design or verification steps
- More design flexibility through later design freeze

Today's Product Lifecycle



- 37% of new digital products were late to market
- Entering the market first can result in up to a 40% greater total profit contribution over the product's life vs. the #2 entrant

Today's Product Lifecycle

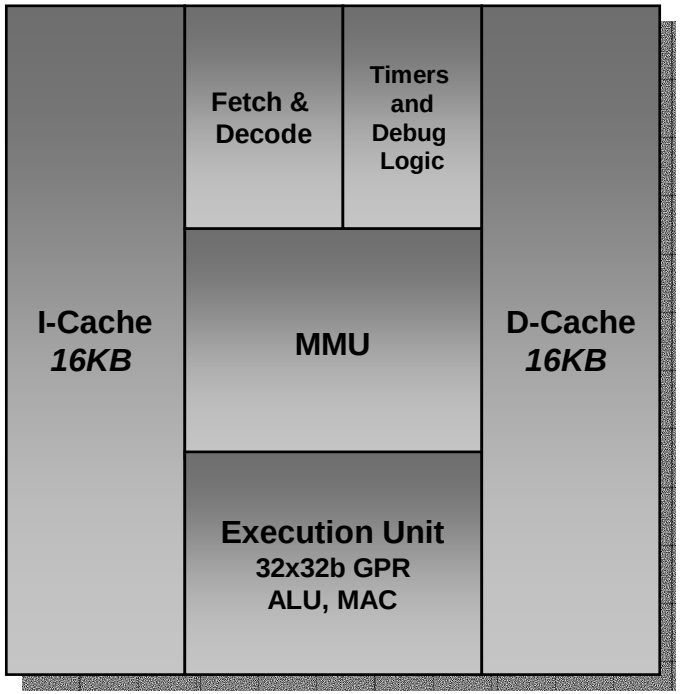
FPGAs rise to the system-level design challenge

- **PLATFORM**
- FPGA
  - Logic, Routing & I/O
- Soft CPUs
- Hard CPUs
- Bus hierarchies
- Memory hierarchies multipliers
- Gigabit I/Os
- RTOS, drivers, network protocol stacks, embedded real-time s/w

- **APPLICATIONS**
- Streaming multimedia
- Network processing
- Software defined radio
- Third+ generation base stations
- Storage area networks

- **DISCIPLINES & DESIGNERS**
- Systems architects, hardware & software engineers, DSP & communications specialists

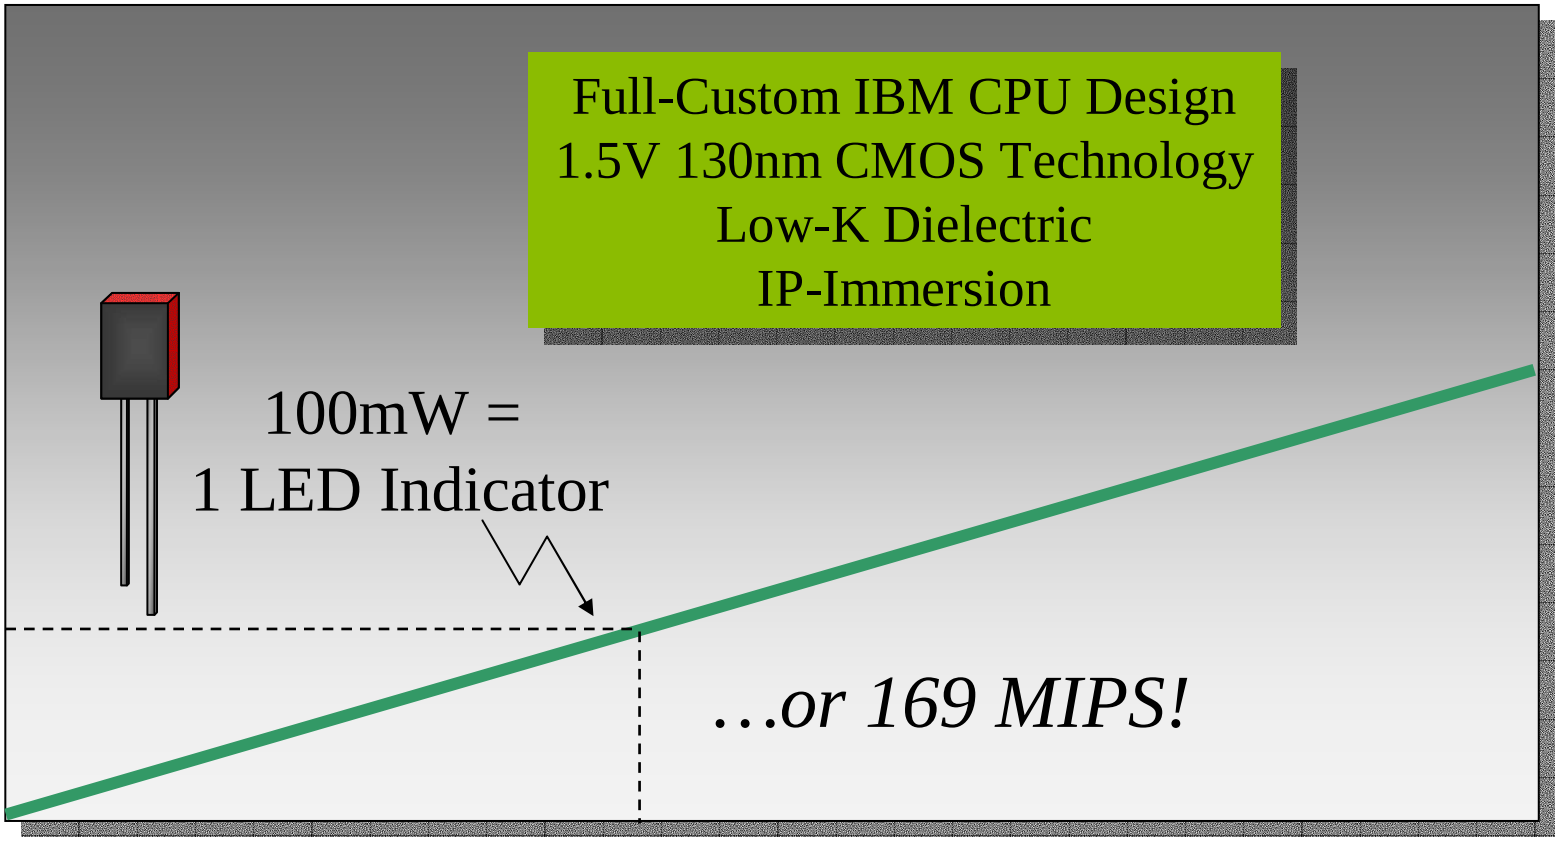
Towards programmable platforms



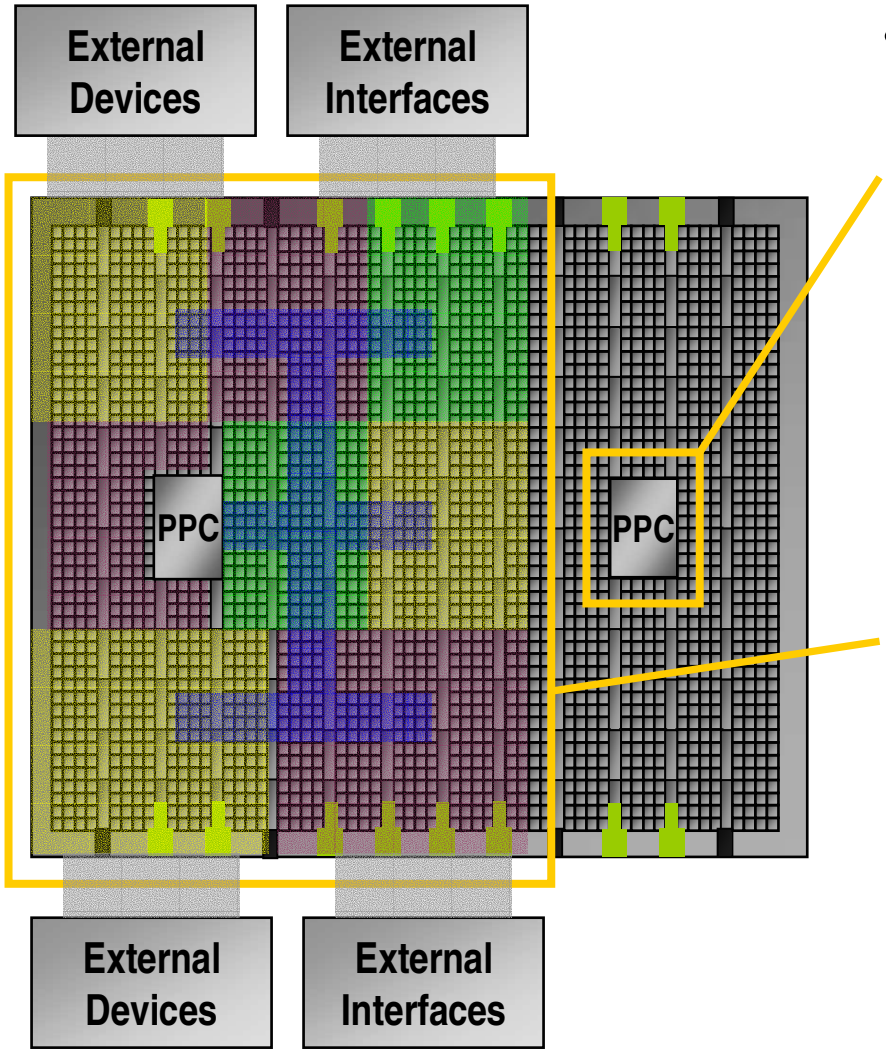
- 32-bit RISC CPU, Harvard Architecture
- 130nm CMOS with 1.5V Operation
- 456 Dhrystone MIPS at 300MHz
- 32 x 32-bit General Purpose Registers
- Hardware Multiply / Divide
- 5-Stage Execution Pipeline
- 16KB D-Cache, 16KB I-Cache
- Memory Management Unit (MMU)
- High-Bandwidth Interface to Logic
- Built-In Hardware Timers
- Built-In JTAG Debug and Trace support

3.8 sq mm = 1% of 2VP100

“Low PowerPC”: 0.59mW/MIPS



System Architecture Options



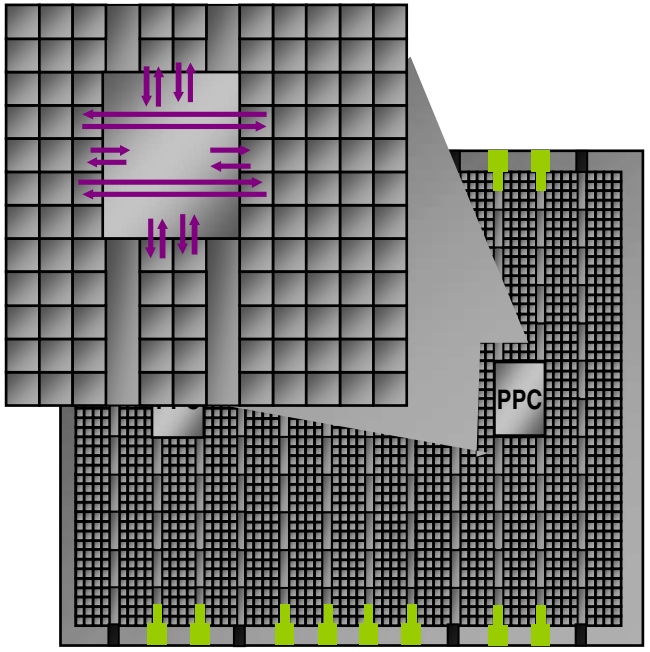
- "Logic-Centric Architecture"
  - PowerPC Executes Entirely out of Cache
  - No FPGA Logic, Memory, or I/O Used
  - 10-20 Pages of C-Code or More
  - Use as Complex Algorithmic Engine
    - Web Server
    - Encryption/Decryption
    - Packet Processor

- "CPU-Centric Architecture"
  - PowerPC forms Heart of Embedded System
  - On & Off-Chip Peripherals
  - External Interfaces
    - e.g. PCI, 3GIO, Gb Ethernet, ZBT SRAM
  - CoreConnect™ On-Chip Bus
    - *Ties System Together*
  - Peripherals implemented in FPGA Logic
  - Typically Runs Embedded OS

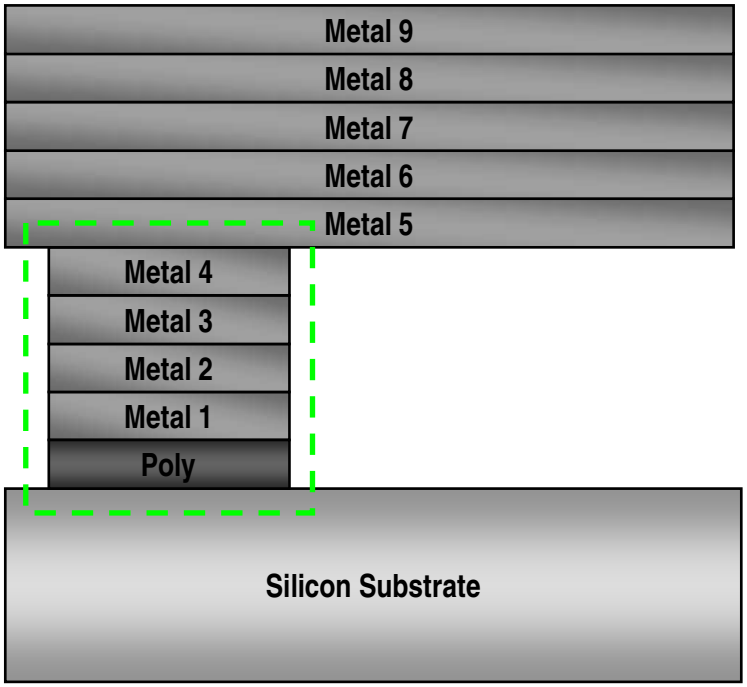
IP-Immersion

Embed multiple IP blocks of arbitrary shape with high-bandwidth connectivity to FPGA core logic, memory & I/O

Technologies Enabling IP-Immersion

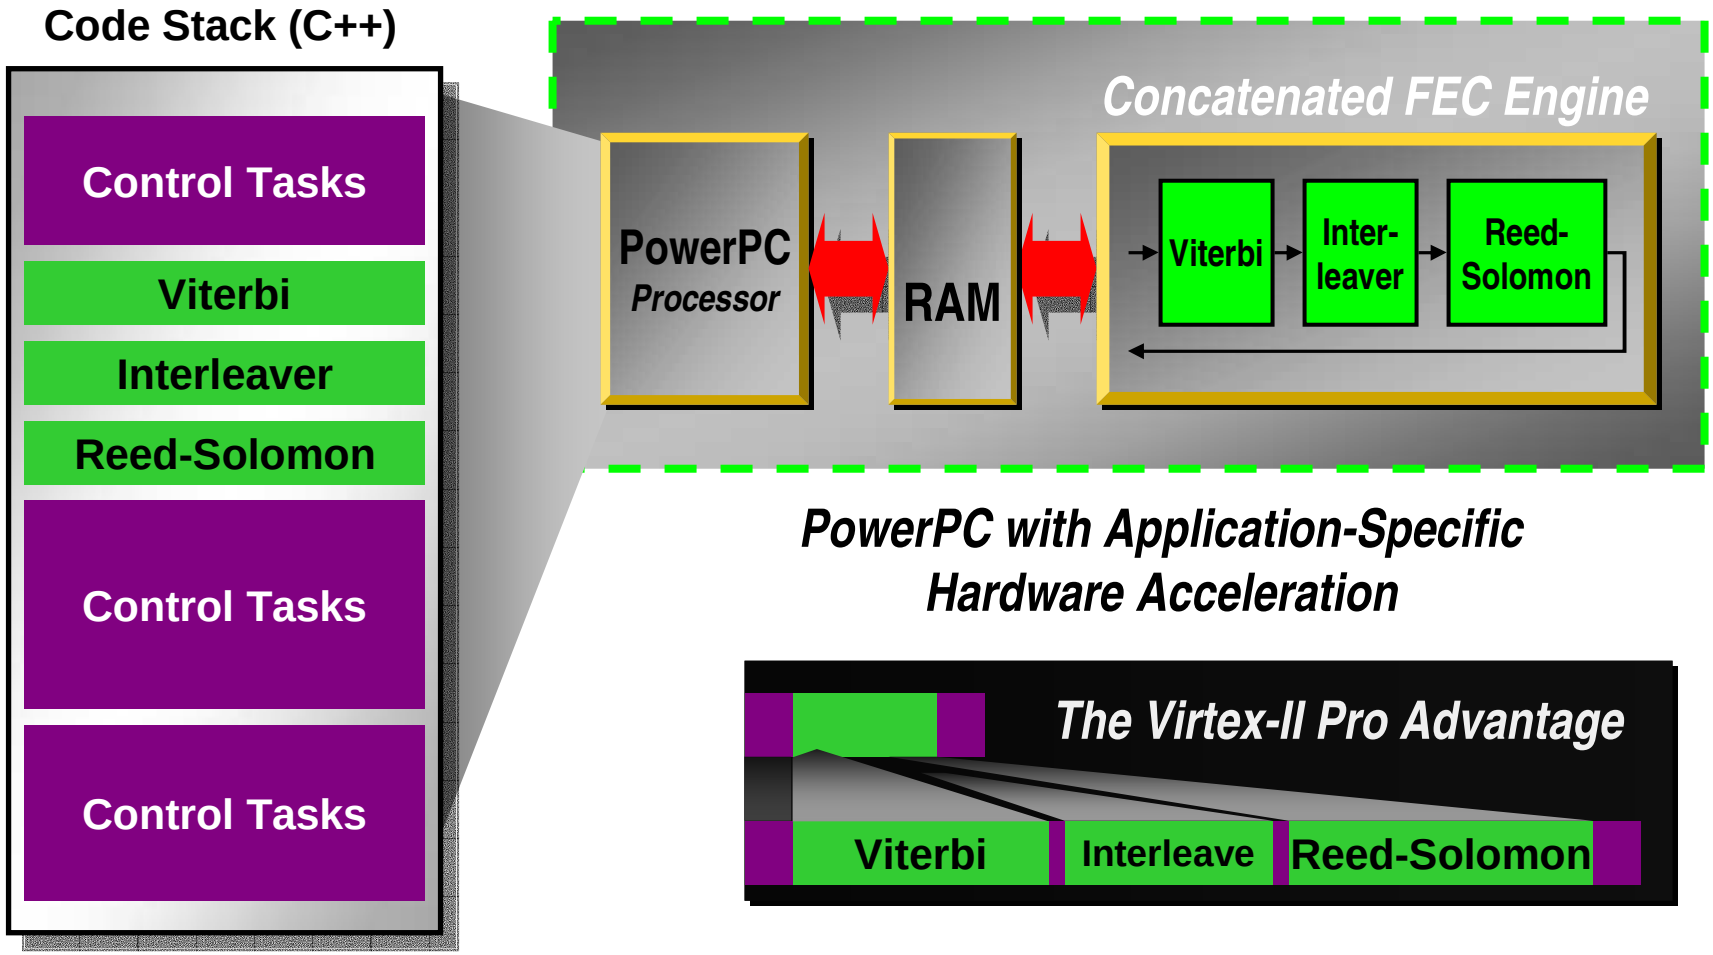


Active Interconnect™
Segmented Routing

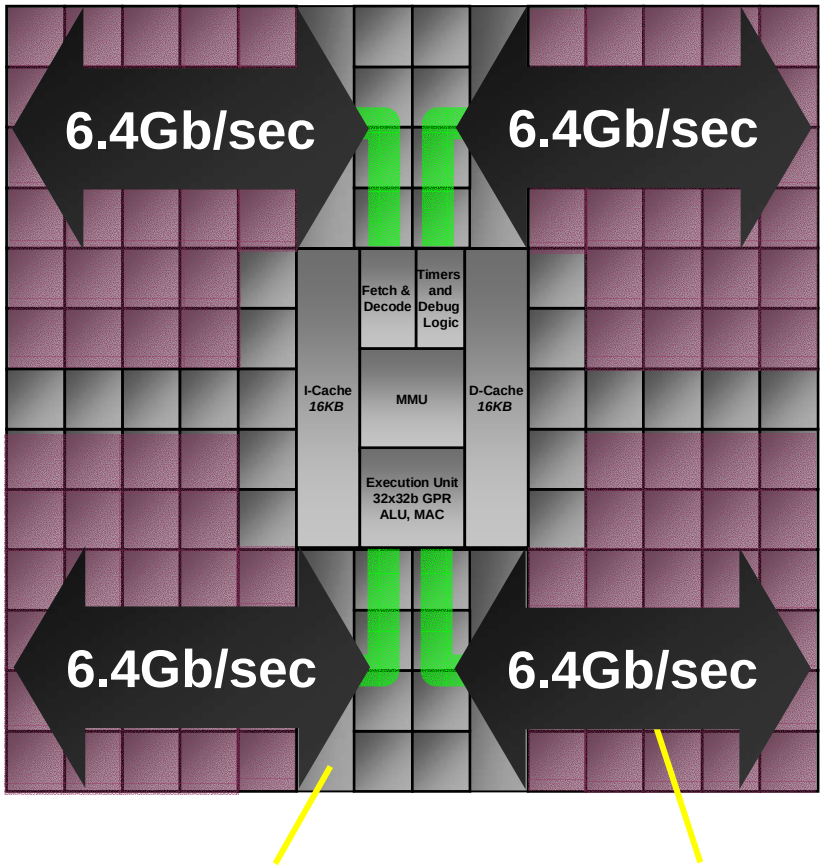


Metal 'Headroom'

HW acceleration

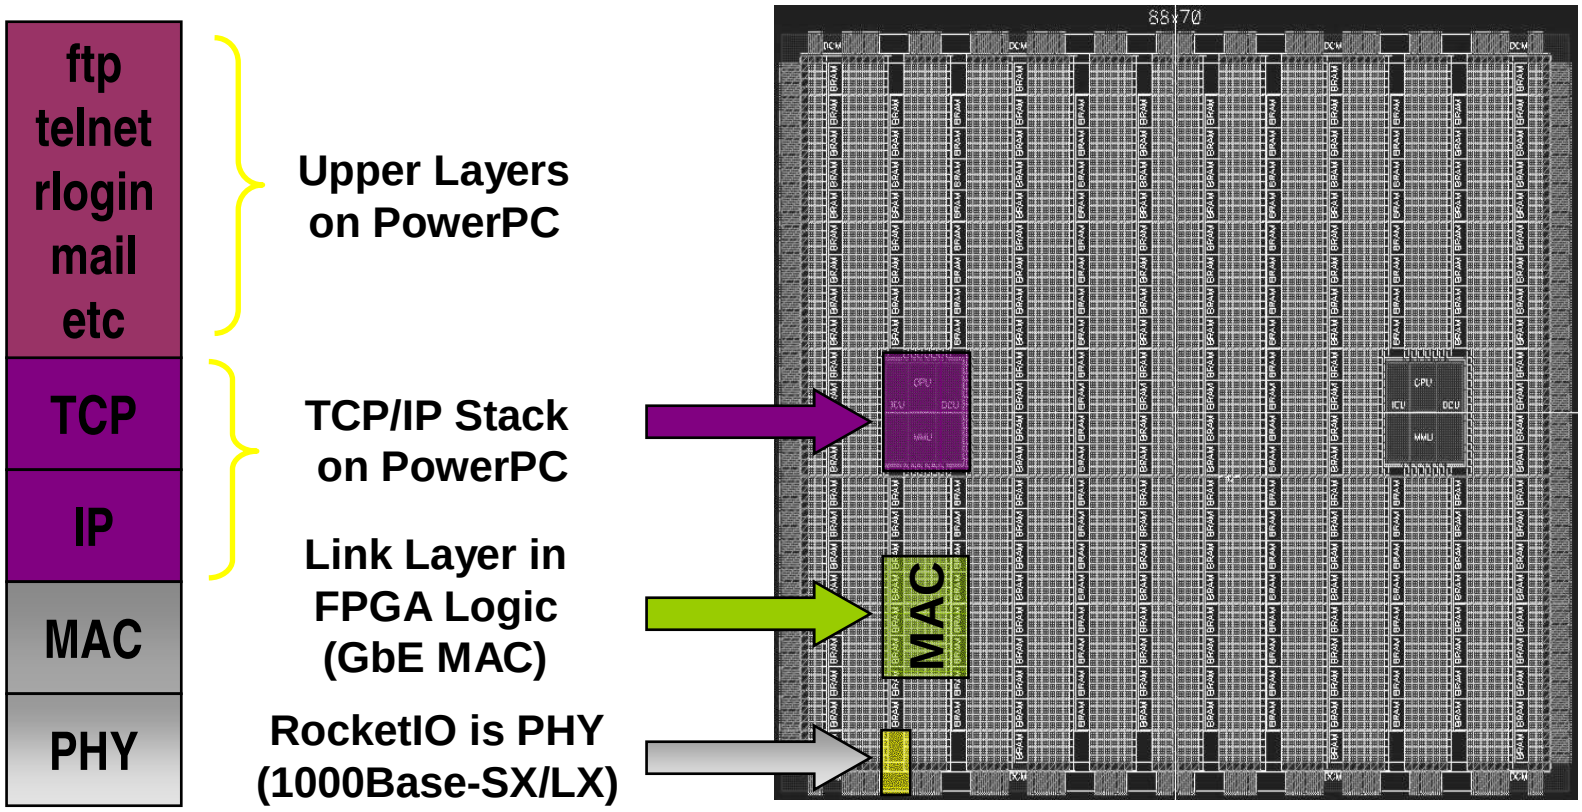


HW/SW Interfacing

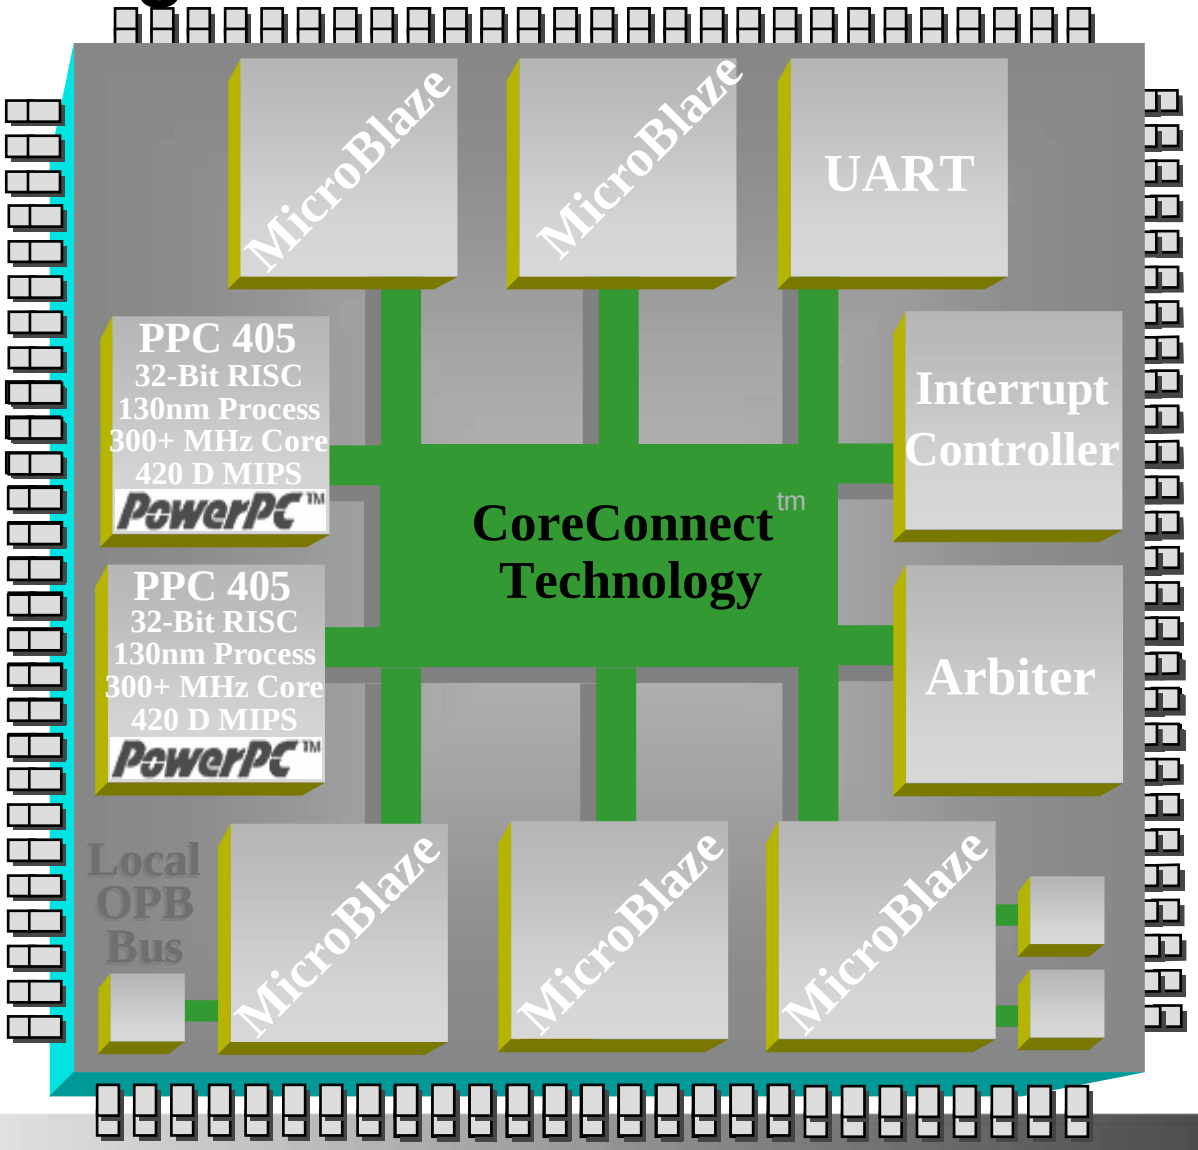


- Provides Specialized Connectivity Between PowerPC & FPGA Logic
- Dual-Port BlockRAM Memory
  - CPU & Logic Each Own 1 Port
- High-Bandwidth
  - 6.4Gb/sec
- Low-Latency
- Non-Caching
  - Designed for Communications Data Processing
- Enables PowerPC & FPGA Logic to Work together on Complex Problems

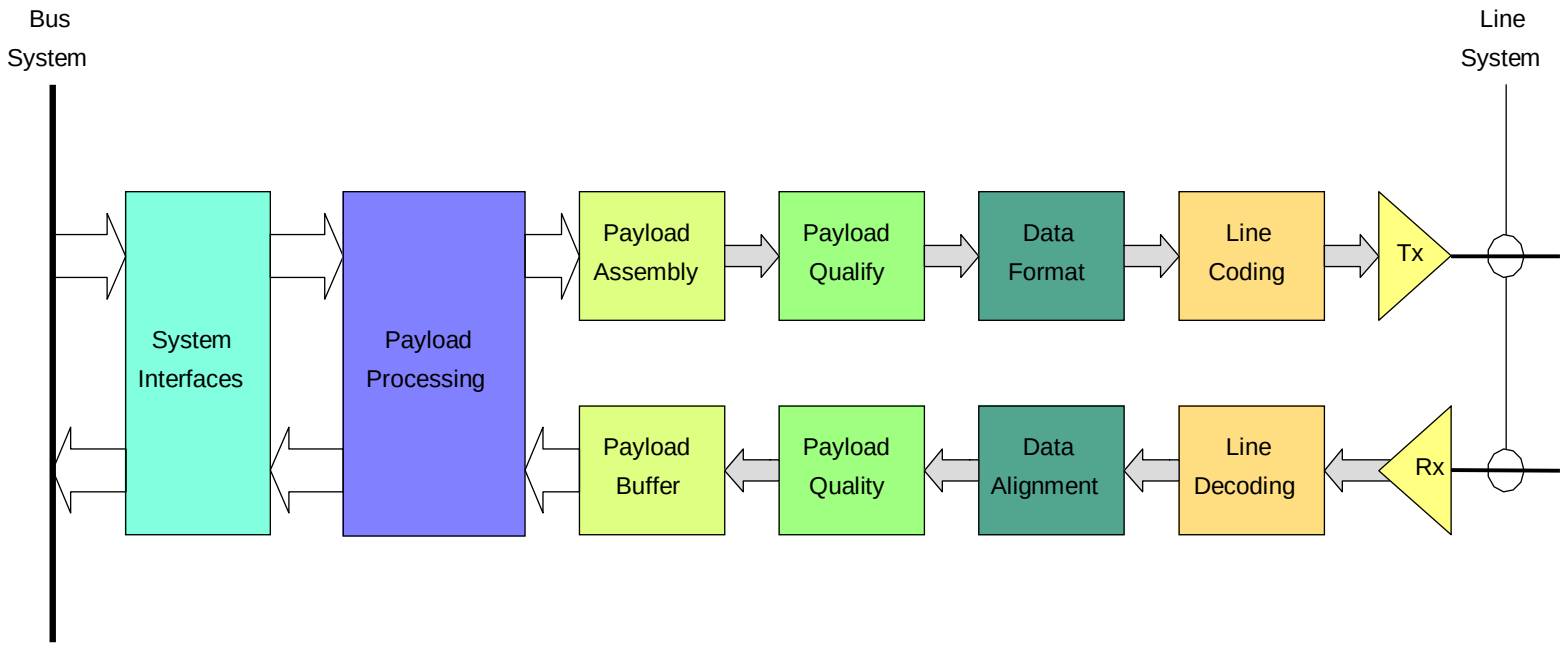
Creating Complete Communications Solutions



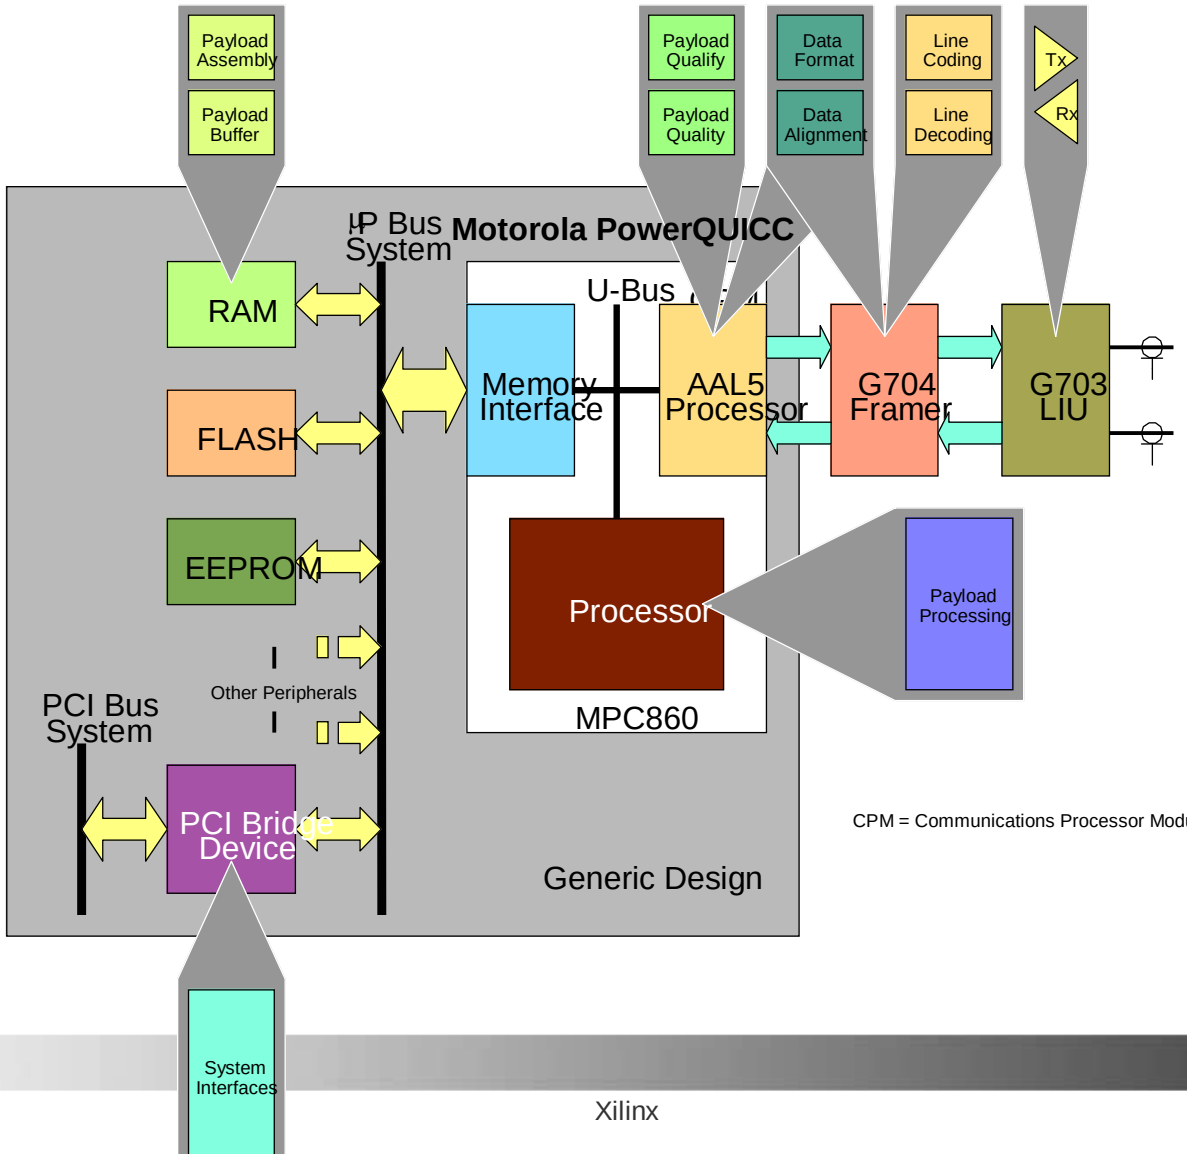
The MicroBlaze™
High Performance Soft CPU



System Exploration in Platform FPGA

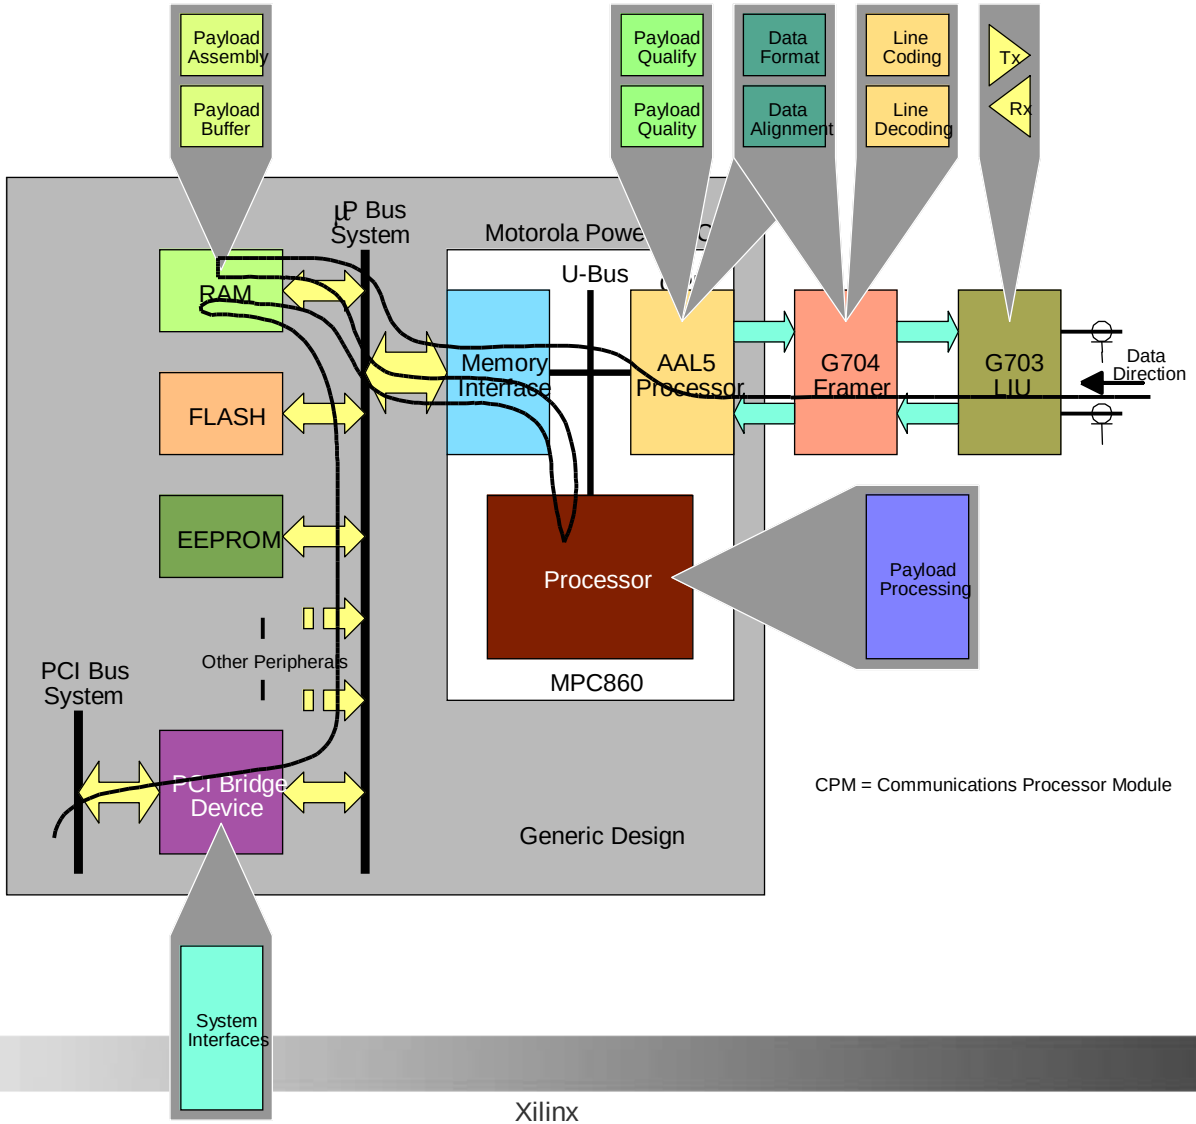


Traditional Architecture

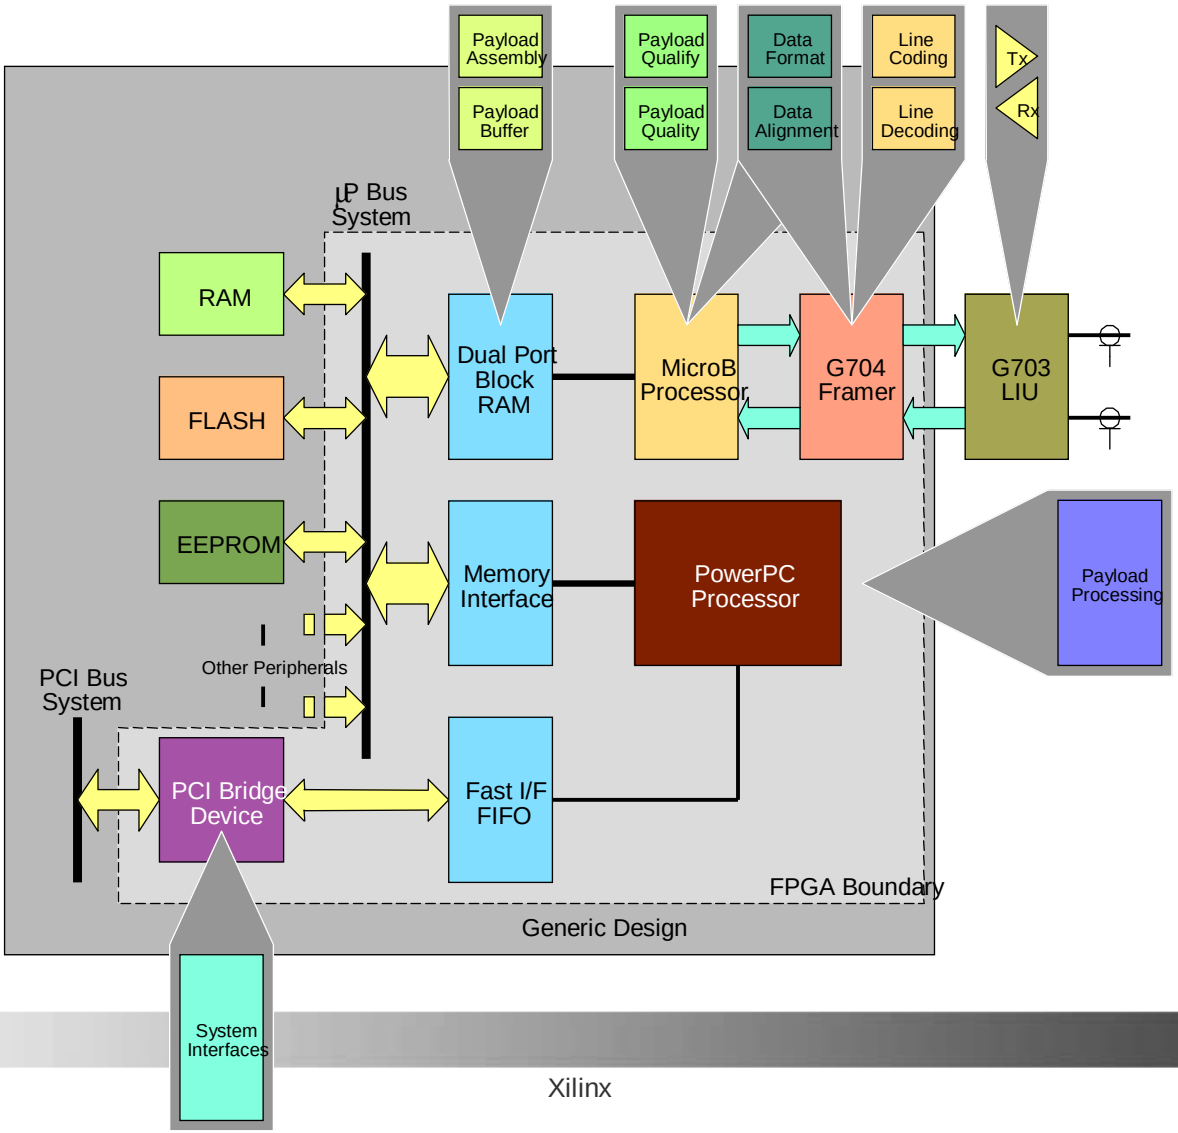


CPM = Communications Processor Module

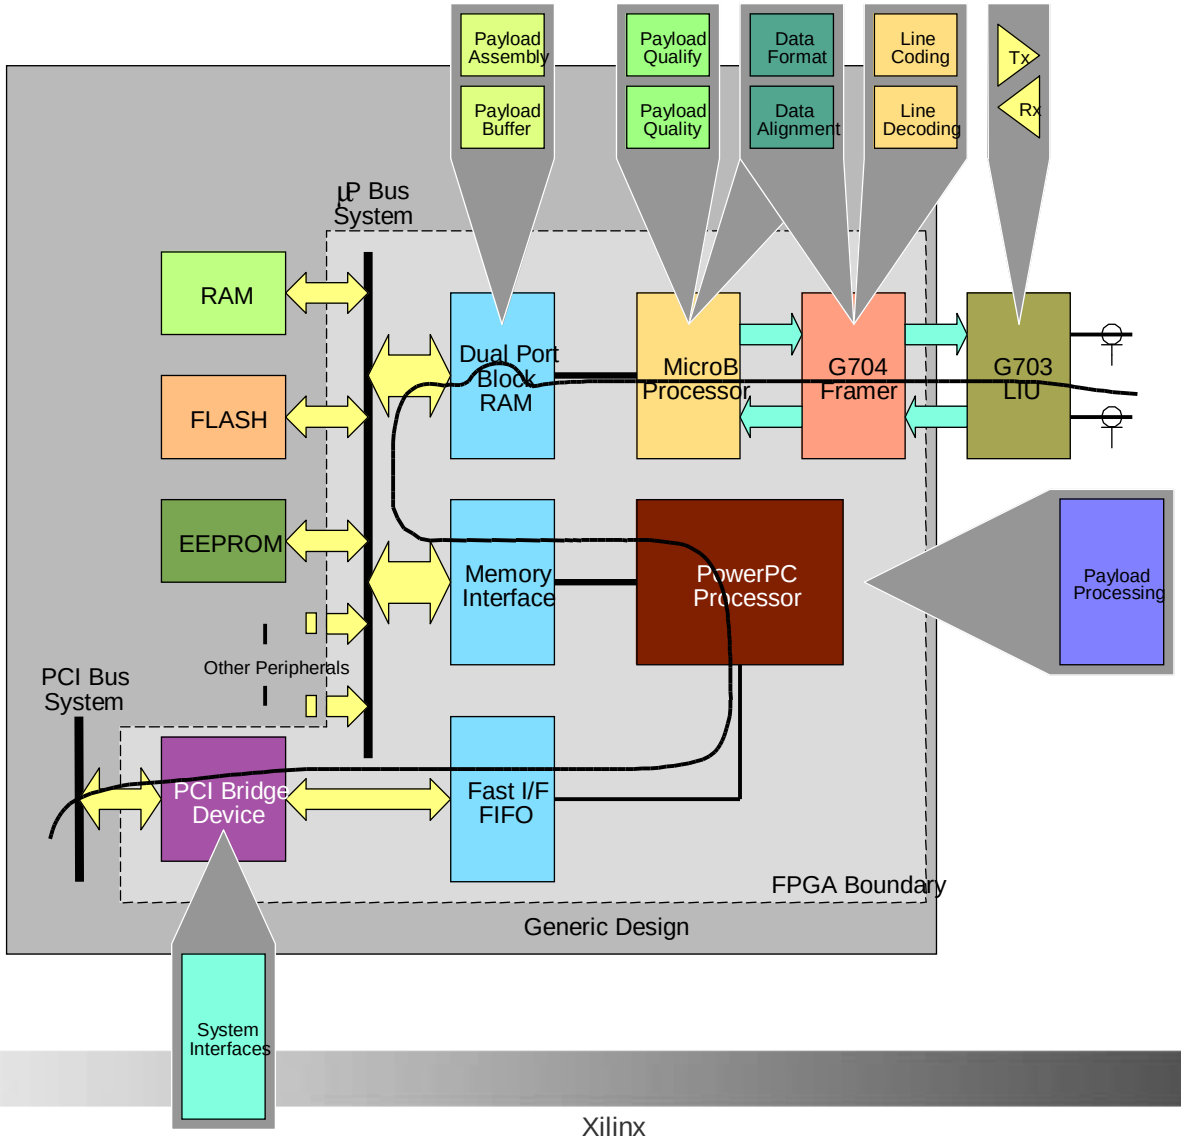
Traditional Architecture



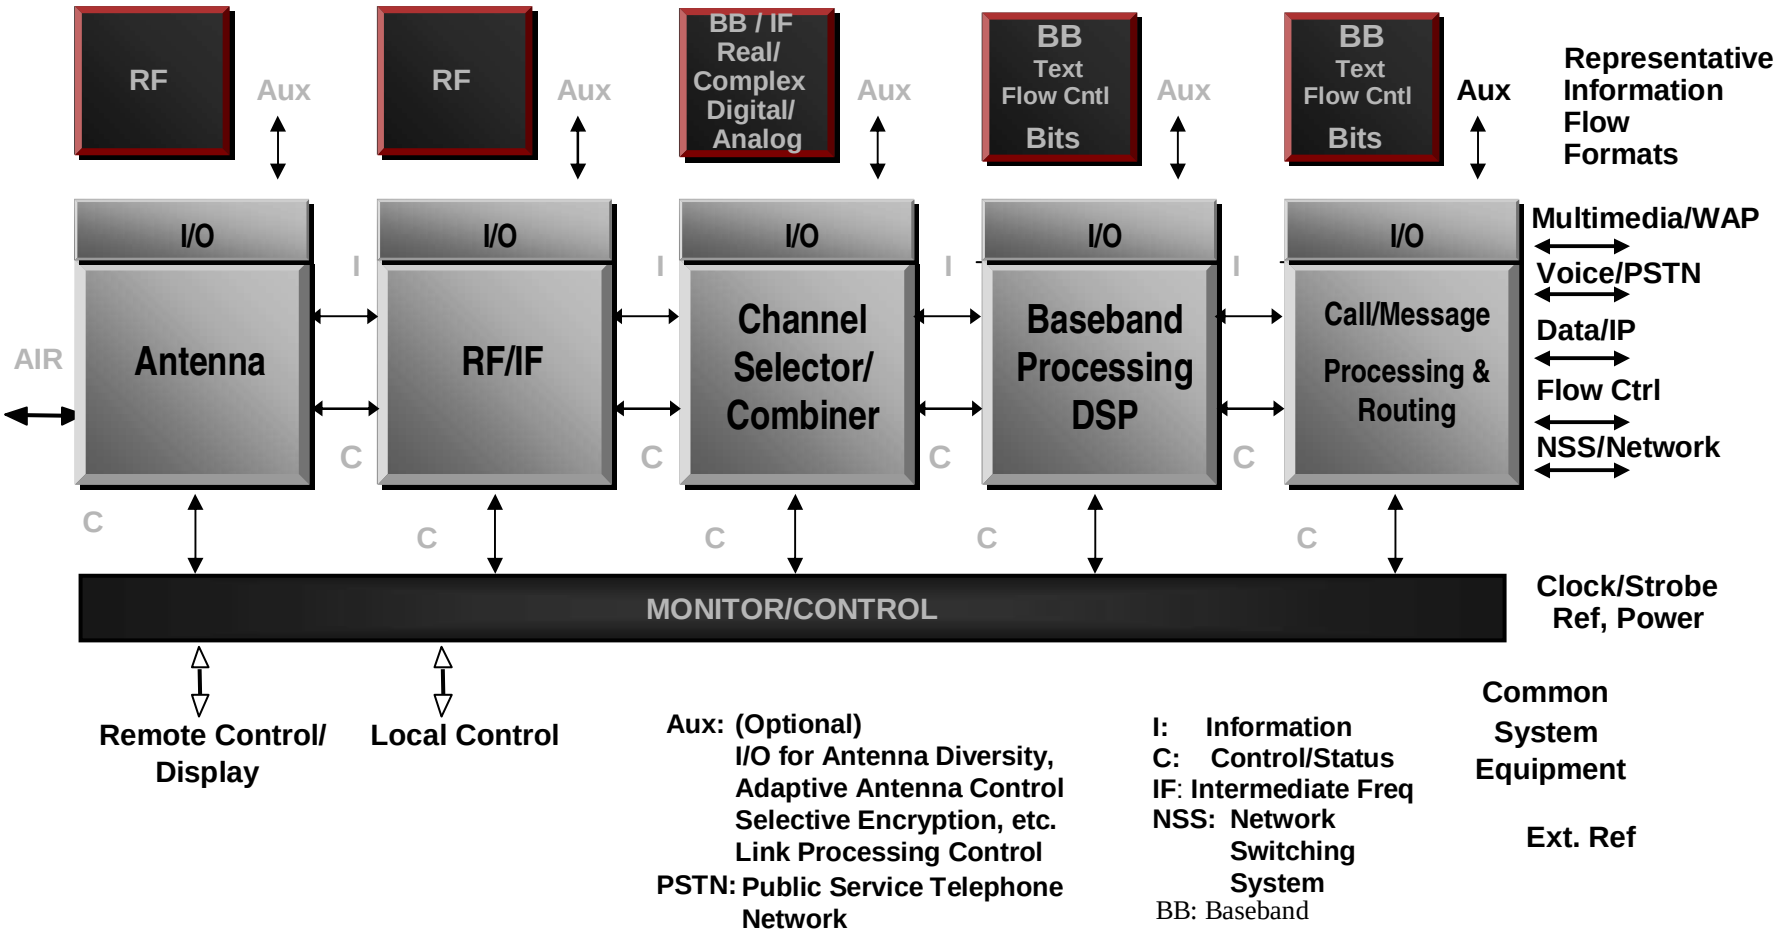
Optimized Architecture



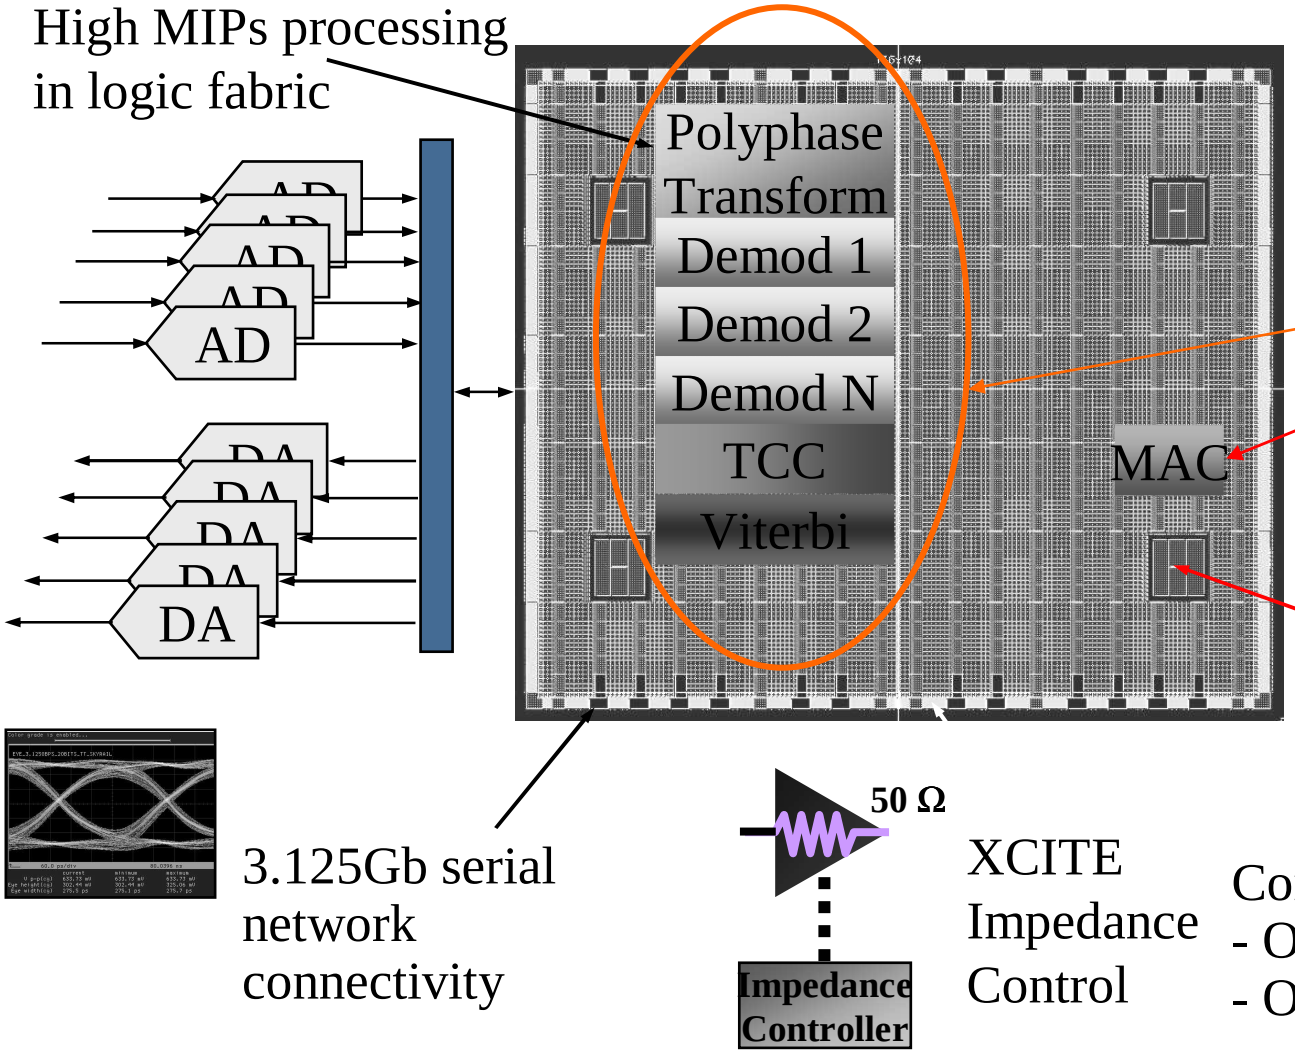
Optimized Architecture



Software Radio Architecture



Re-invent the Signal Processing Platform



- Heterogeneous platform
- Address complex signal processing systems

Radio PHY

MAC (Media Access)

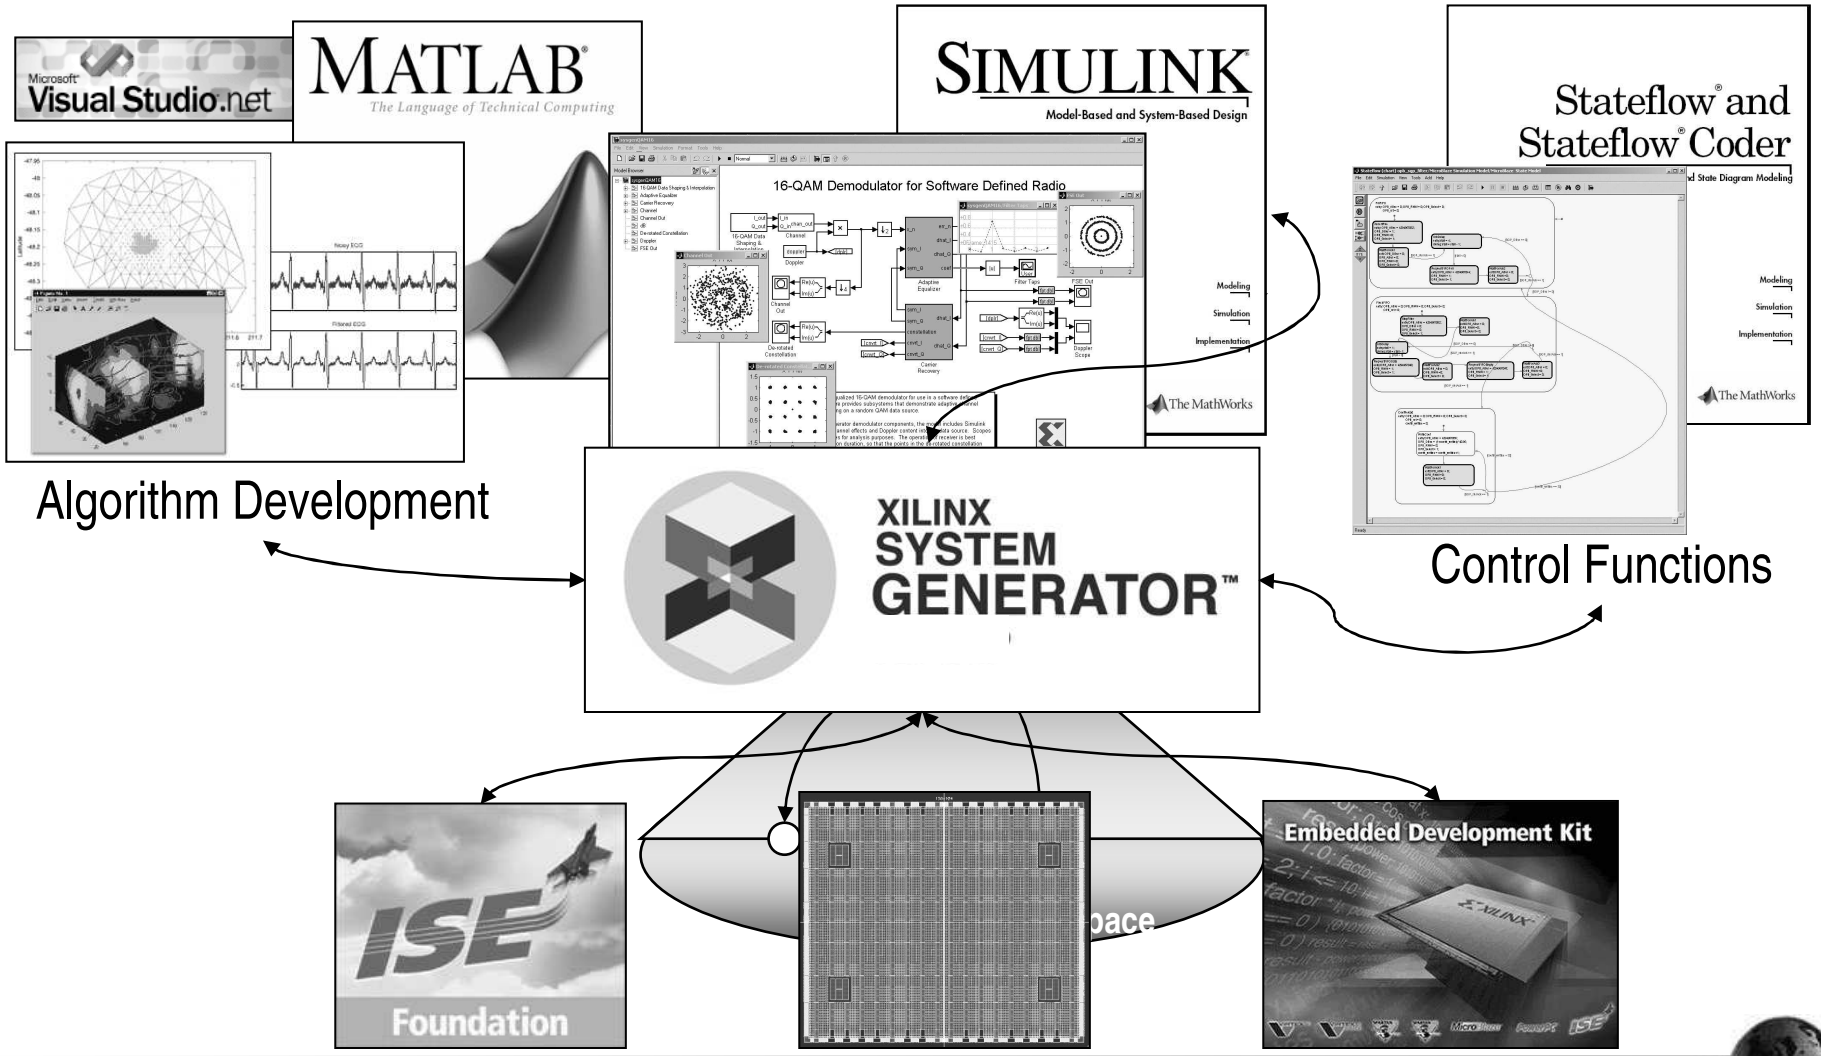
PPC405
- Decision oriented tasks
- CORBA
- Java Virtual Machine
- NBAP
- SCA

3.125Gb serial network connectivity

XCITE Impedance Control

Connectivity to
- Other components
- Other FPGAs

Platform-Based Design

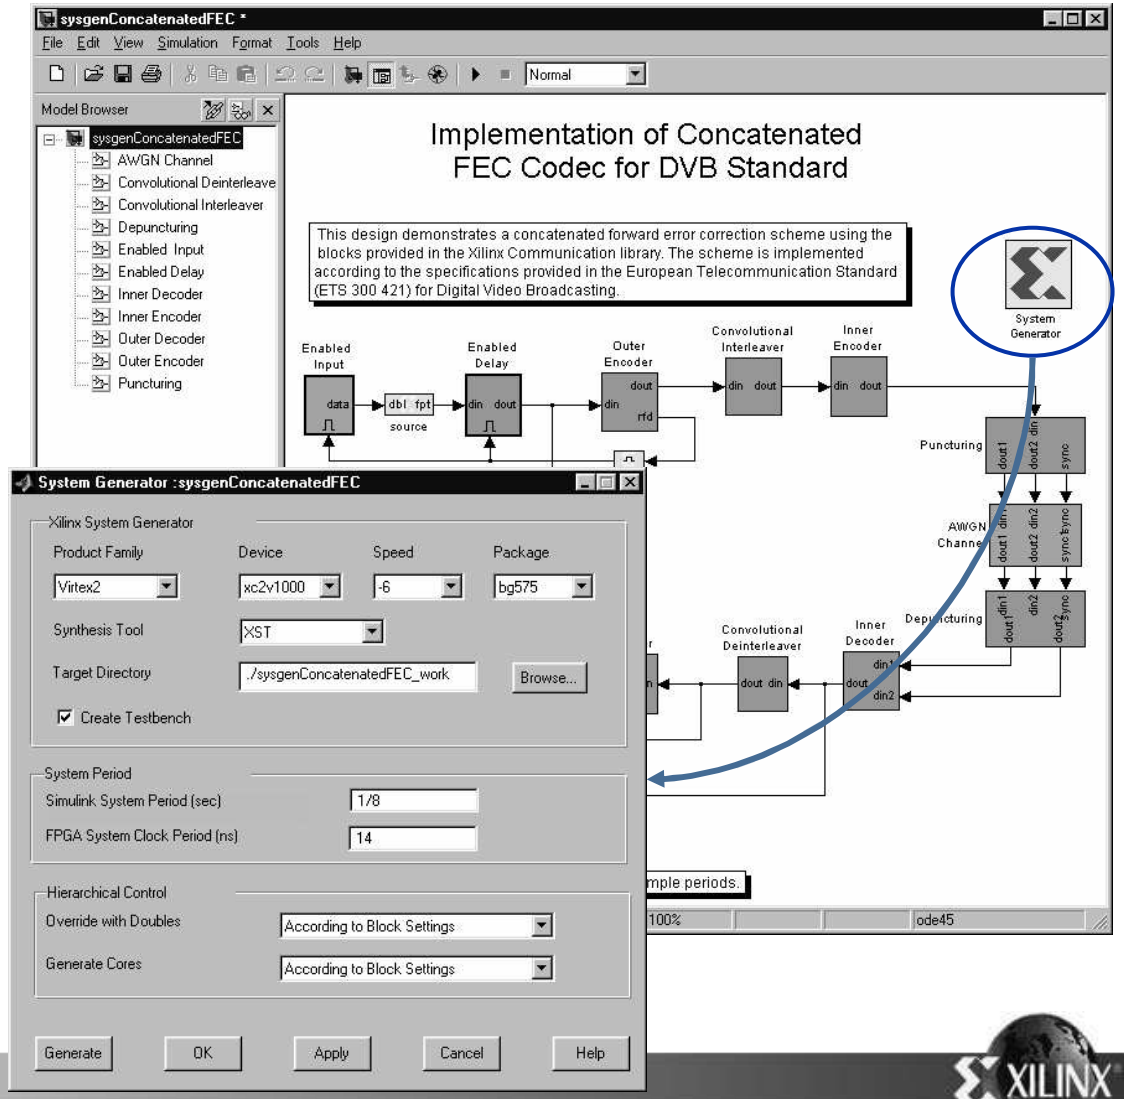


System Generator for DSP

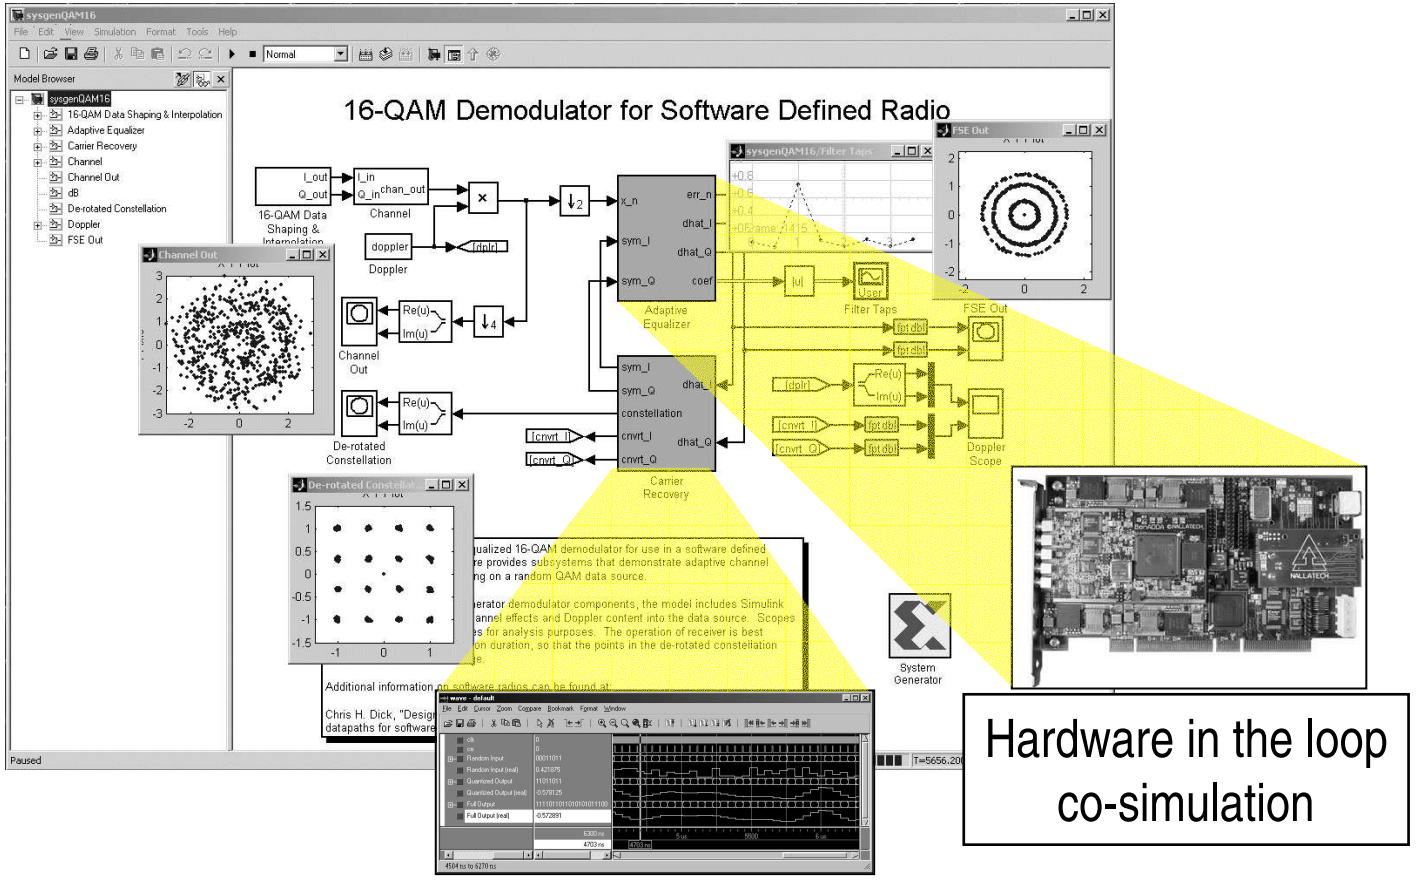
- Visual data flow paradigm
- Polymorphic block libraries
- Arbitrary precision fixed-point
- Bit and cycle true modeling

- Seamlessly integrated with Simulink and MATLAB
  - Test bench and data analysis

- Automatic code generation
  - Synthesizable VHDL
  - IP cores
  - HDL test bench
  - Project and constraint files



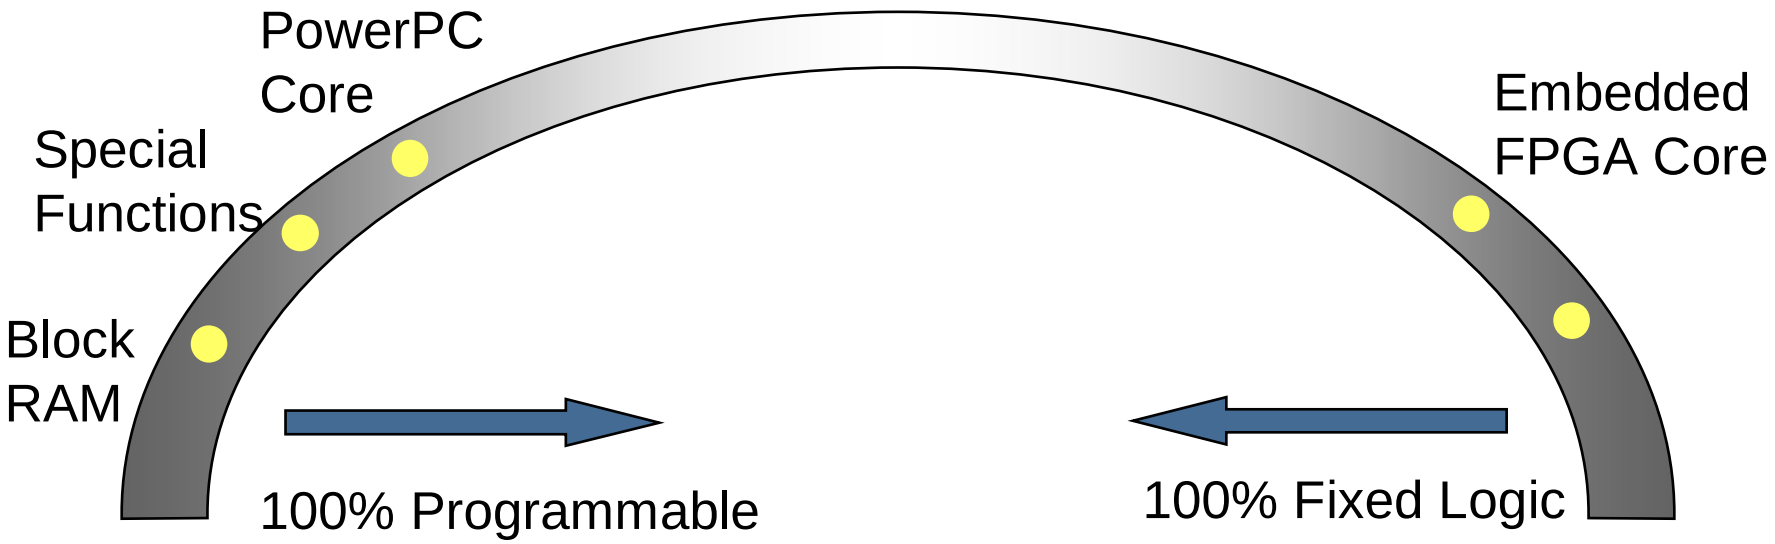
Heterogenous Implementation



Where We Are Going
FPGA 2005

Process Technology	65 nm, 10 layers Cu
Transistors	1B
Logic Cells	200K
Block RAM	15Mb
IO Speed	10Gb/s
Embedded Processors	Many
Embedded DSP Blocks	Very Many
Embedded Mixed Signal Blocks	Yes

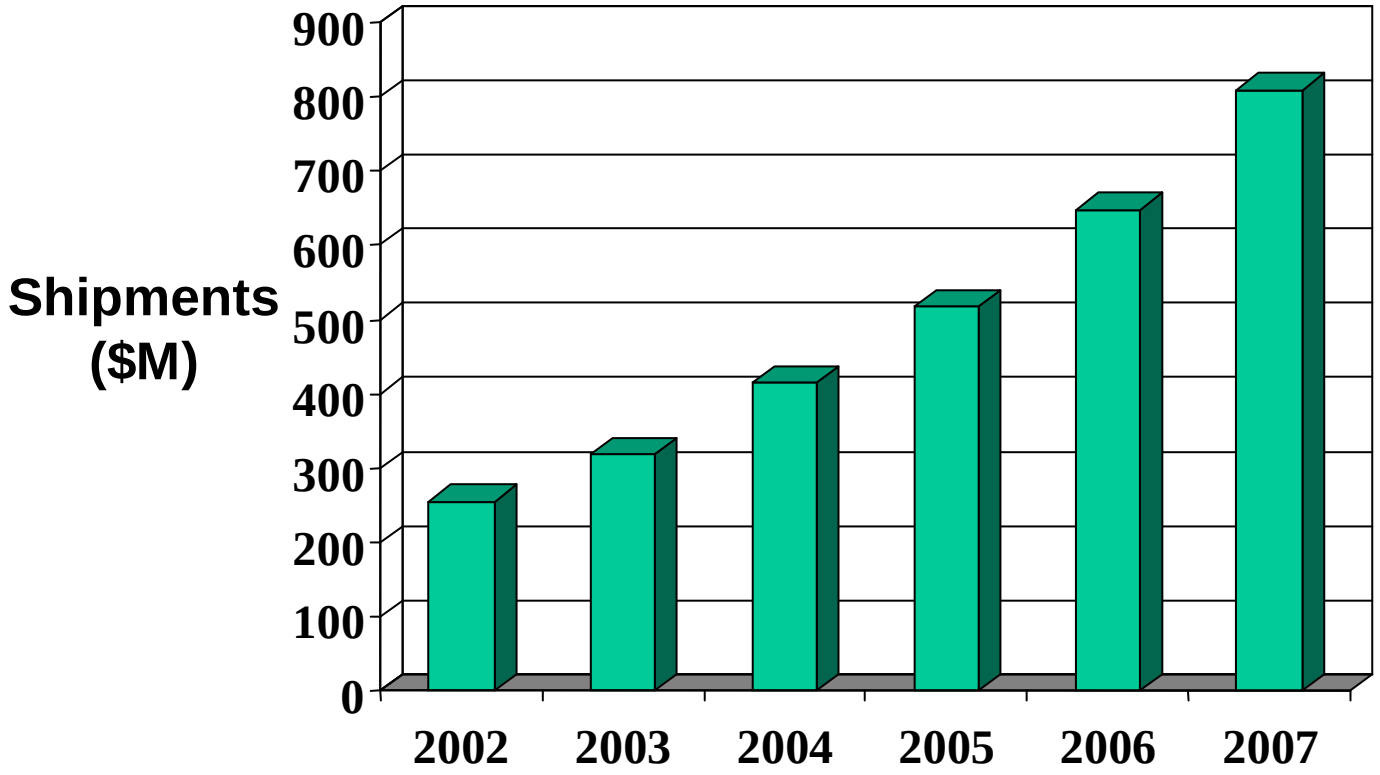
Combining the Best of FPGA and ASIC



Traditional FPGA Market

- Flexible, but expensive

Reconfigurable Chips for Digital Signal Processing
(FPGAs, PLDs, Reconfig. Data Paths)

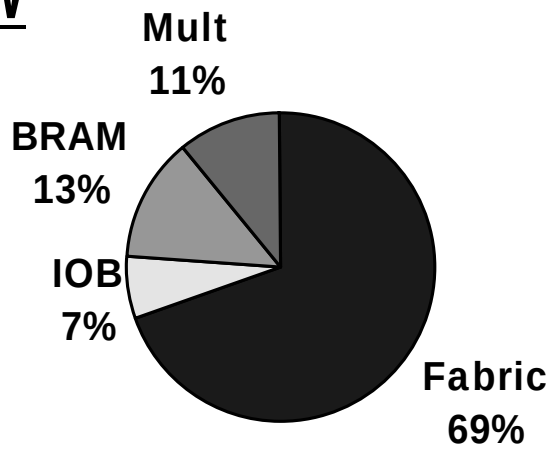


2002-2007 CAGR of 26.0%

Source:
Forward Concepts
February, 2003

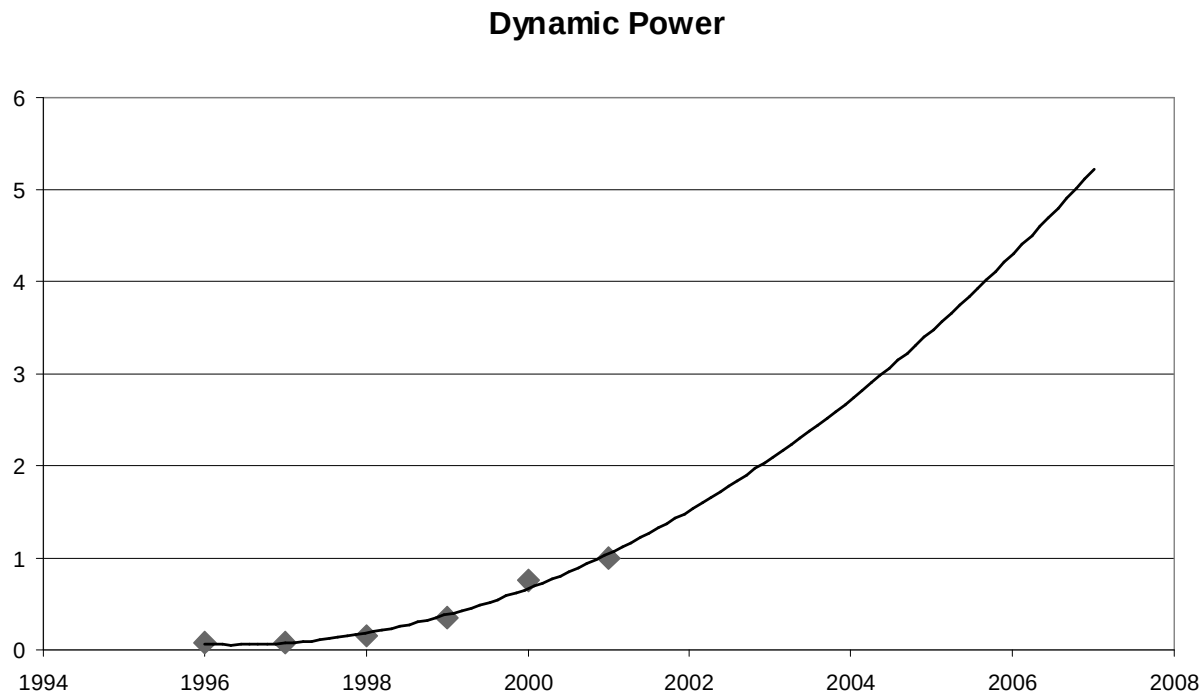
Power Analysis

- Typical design
  - 5.9uW/CLB/MHz [FPGA00]
  - Fabric power is ~69% of total power
  - 2V6000 = 5.9uW/CLB/MHz · 8448CLBs · 100MHz ÷ 69% = **7.5W**



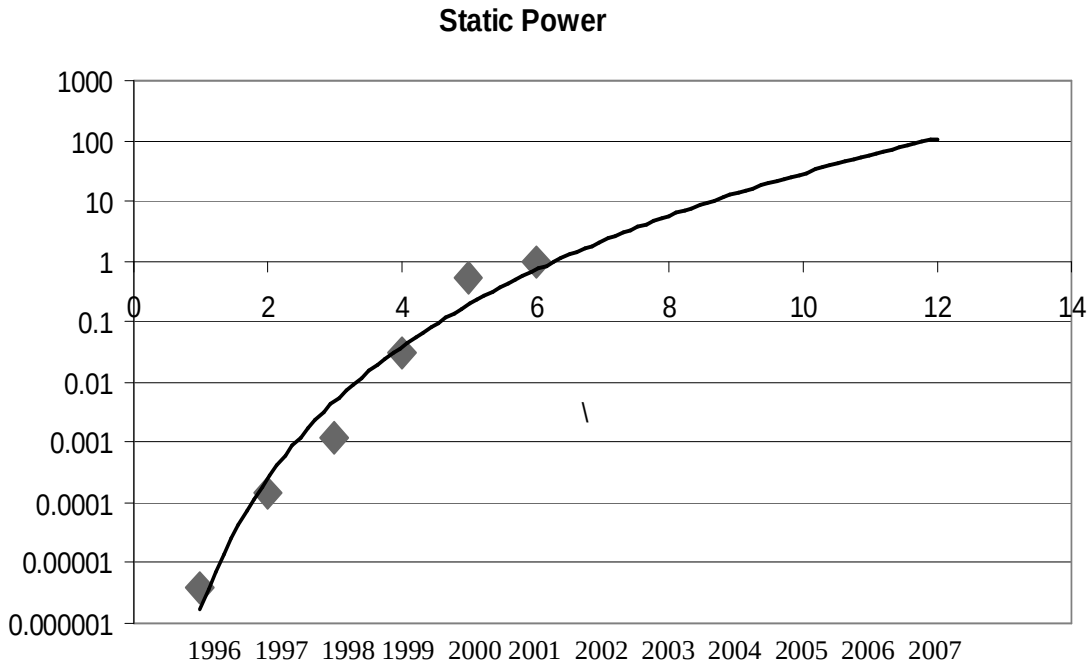
Dynamic Power

- Normalized to 2001
  - Best fit is a quadratic trend line
  - Predicts 5X by 2007

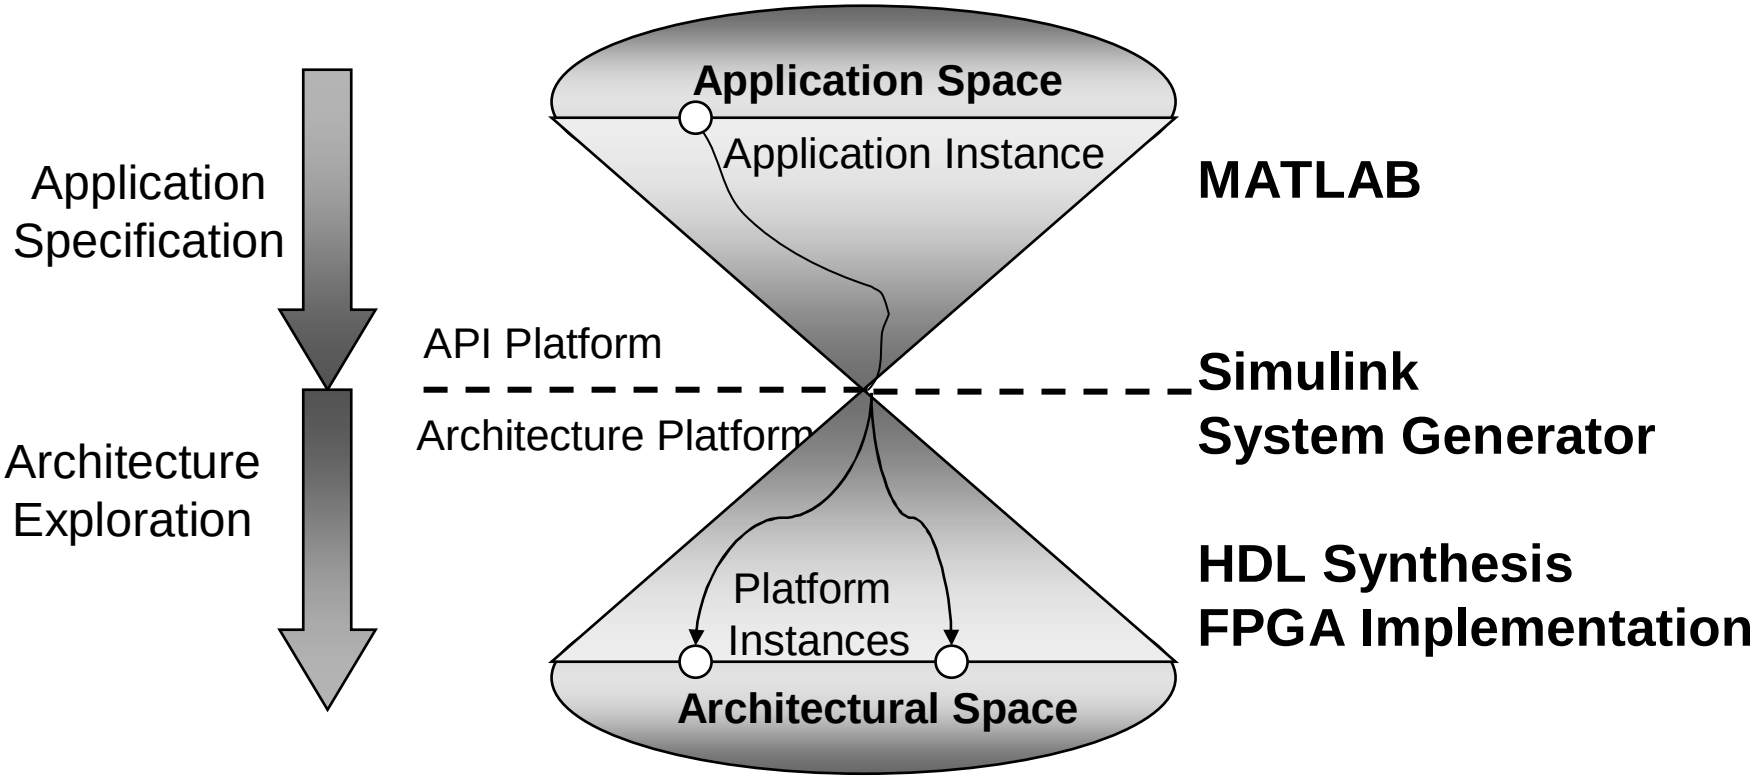


Static Power

- Normalized to 2001
  - Best fit is a power trend
  - Predicts 100X by 2007

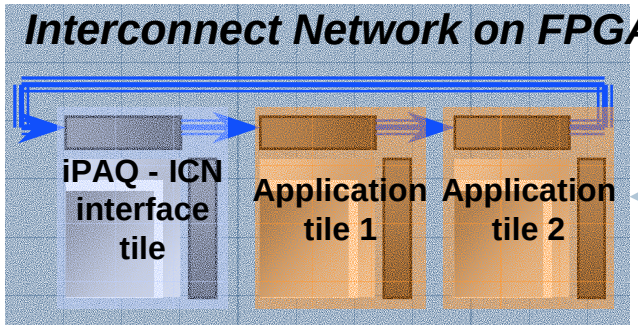


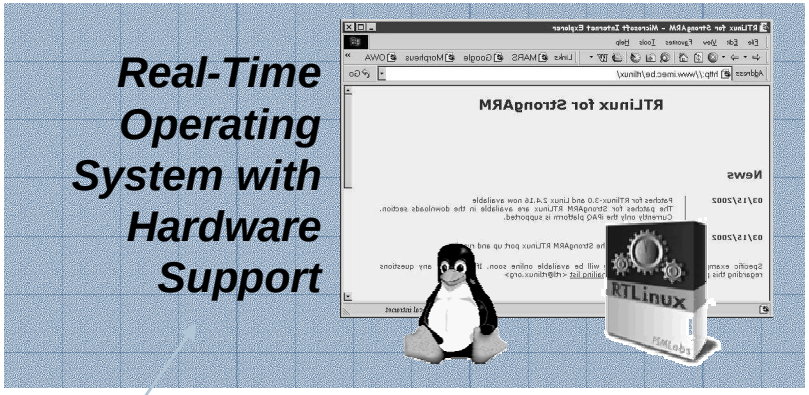
Platform-Based DSP Design

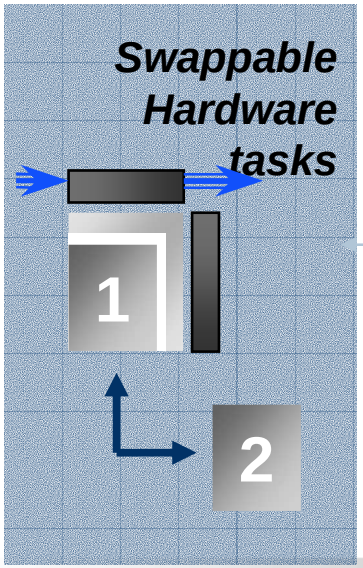


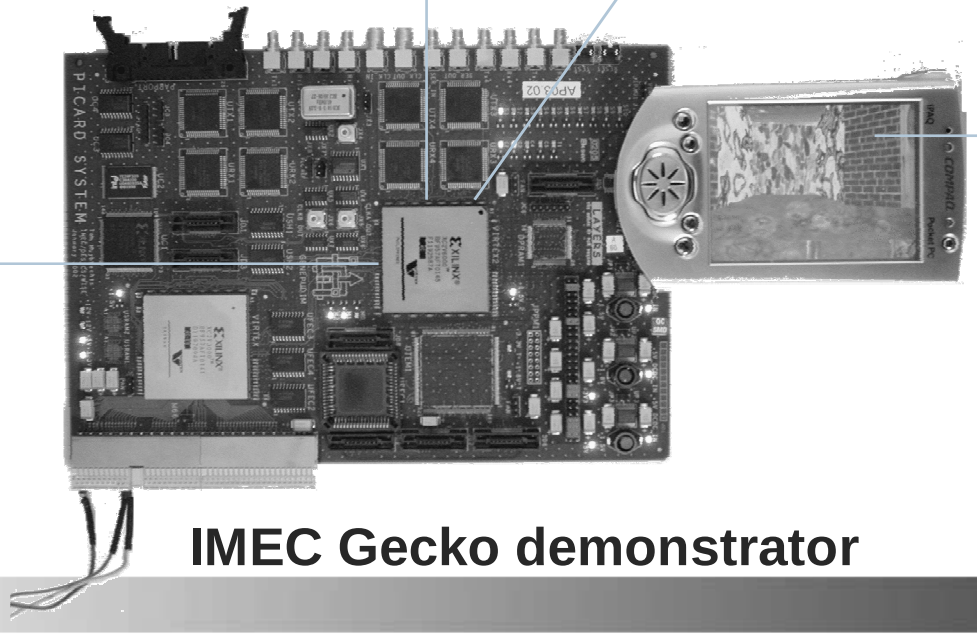
Goal: Provide a *software platform* to support the Platform FPGA

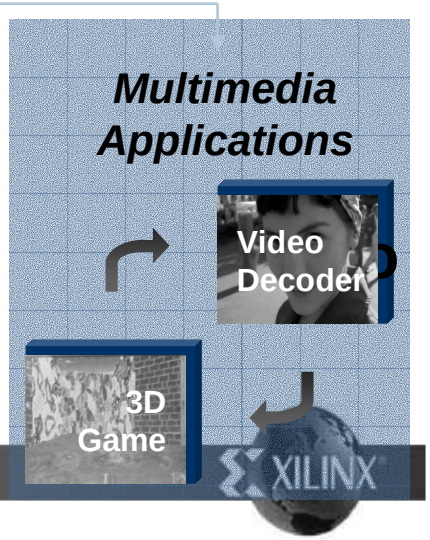
Future use model





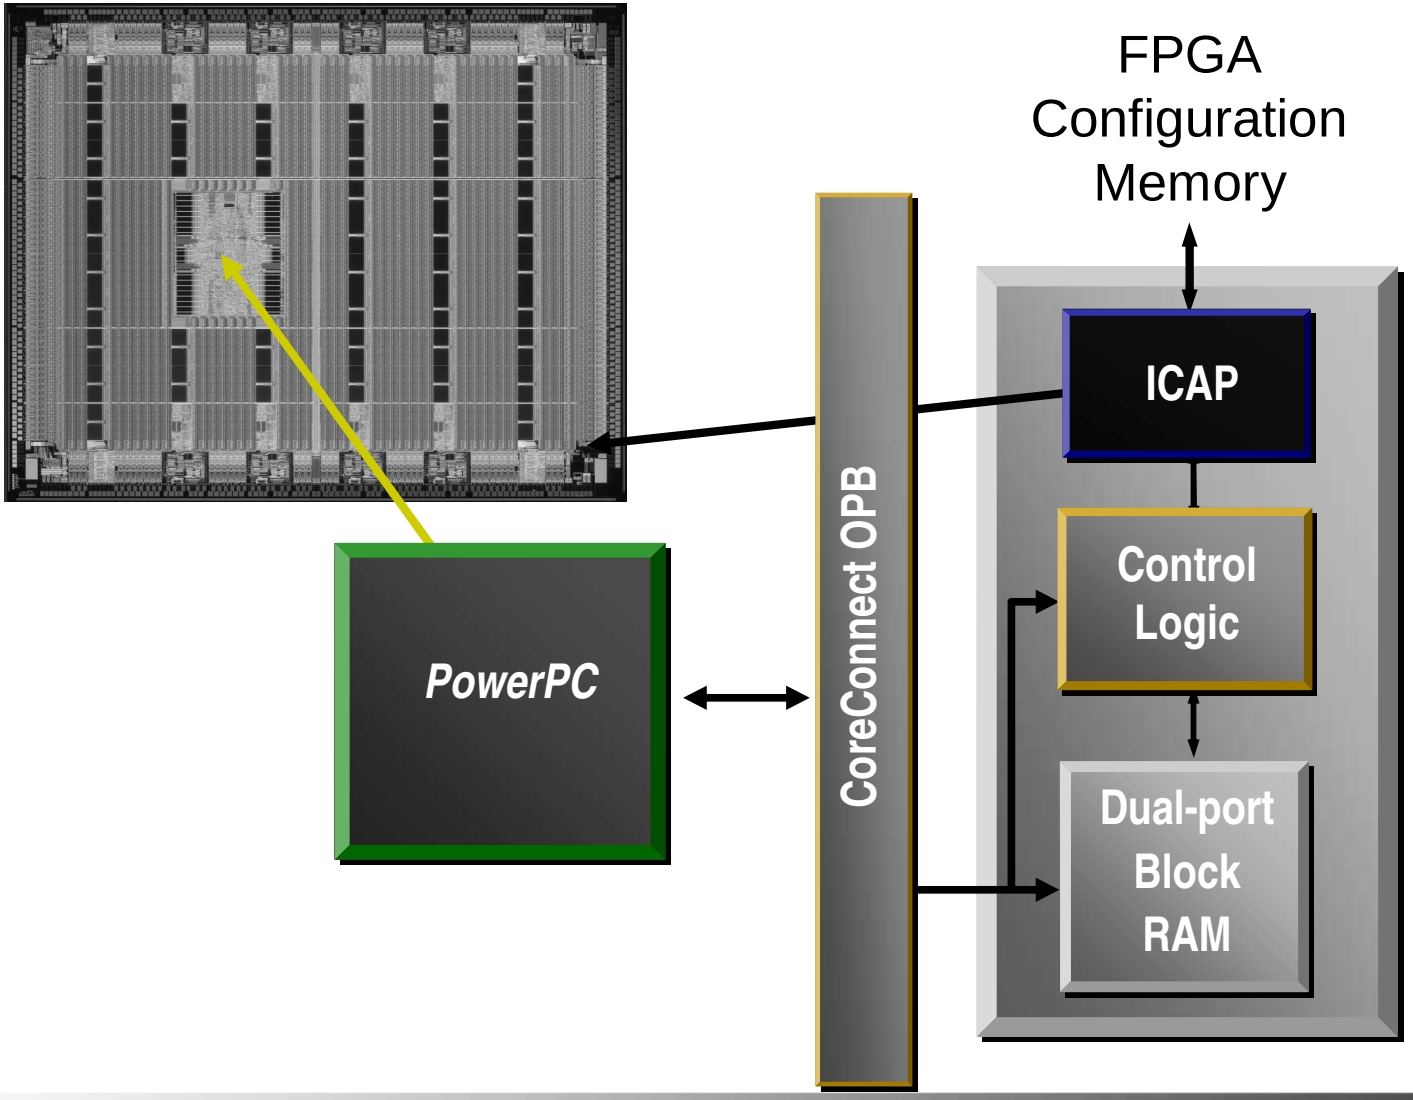




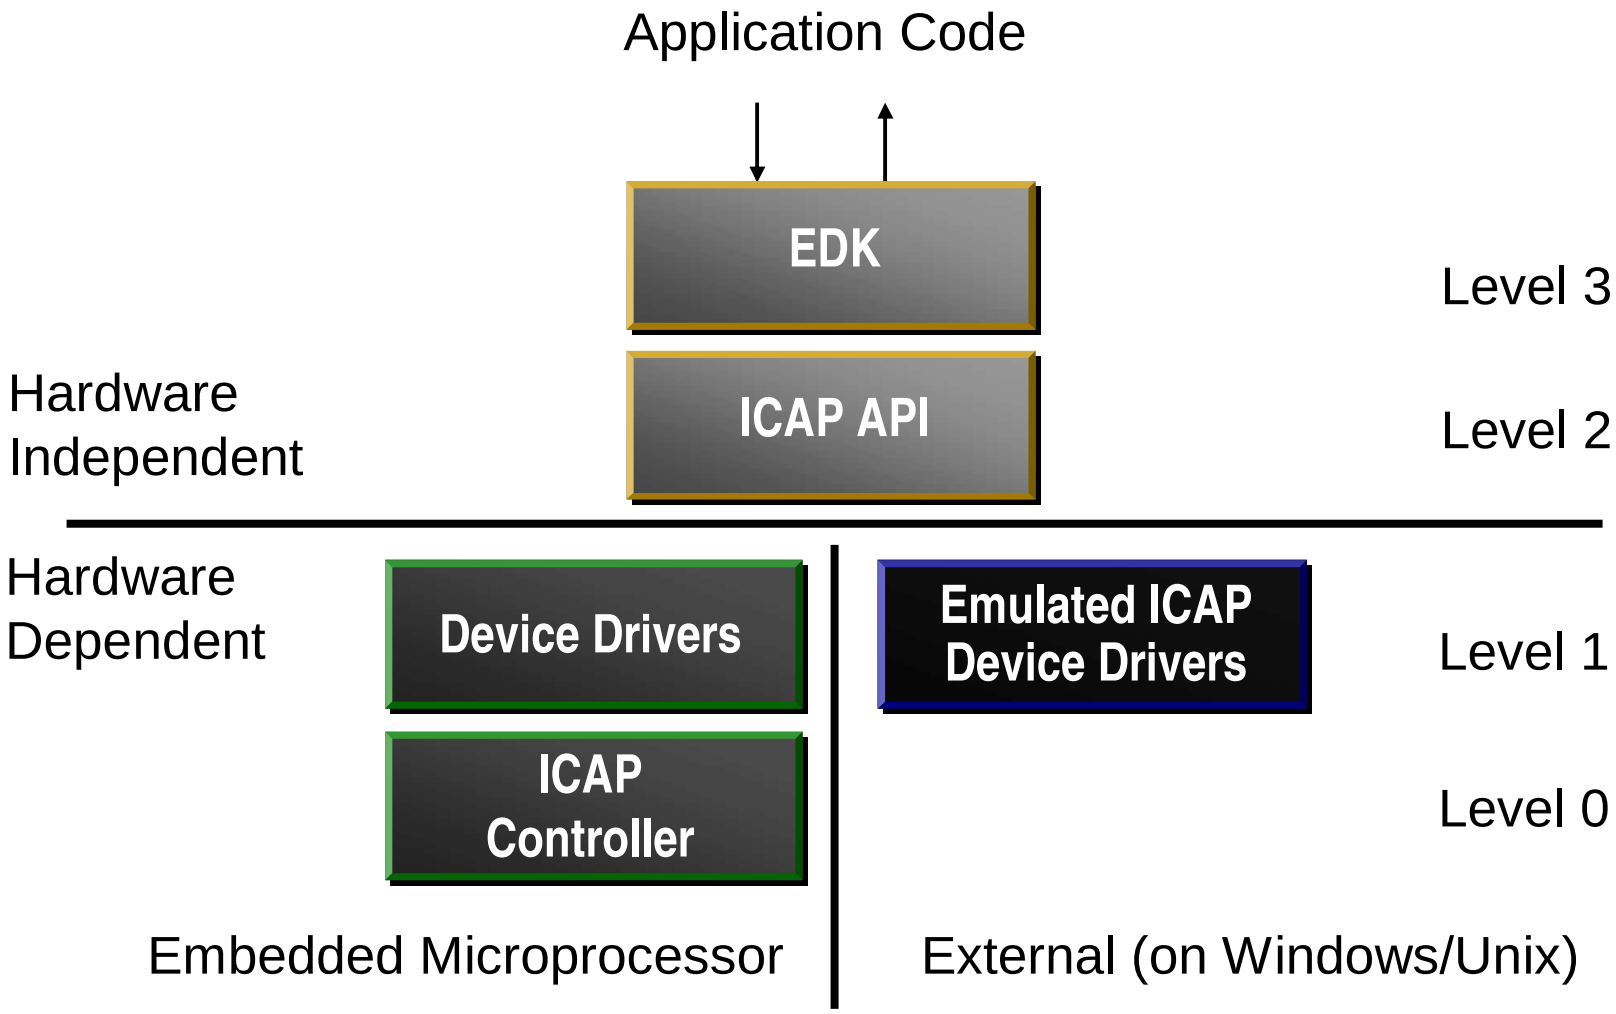


IMEC Gecko demonstrator

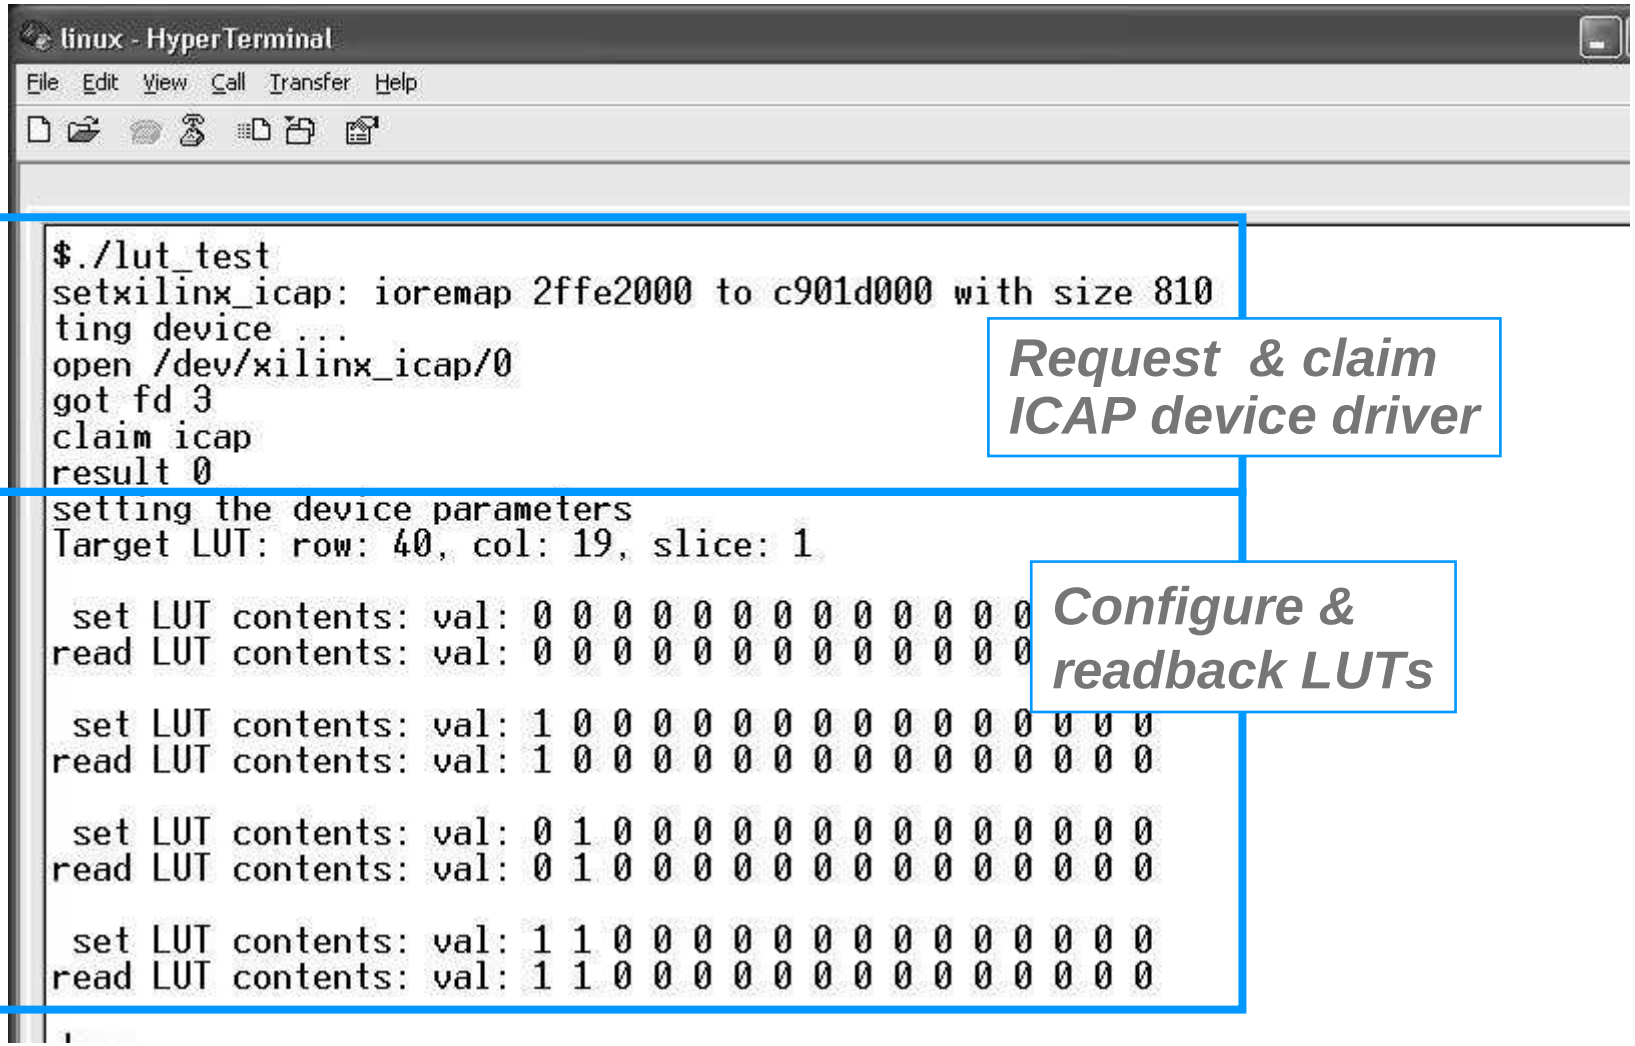
Partial Runtime Reconfiguration



Software Stack



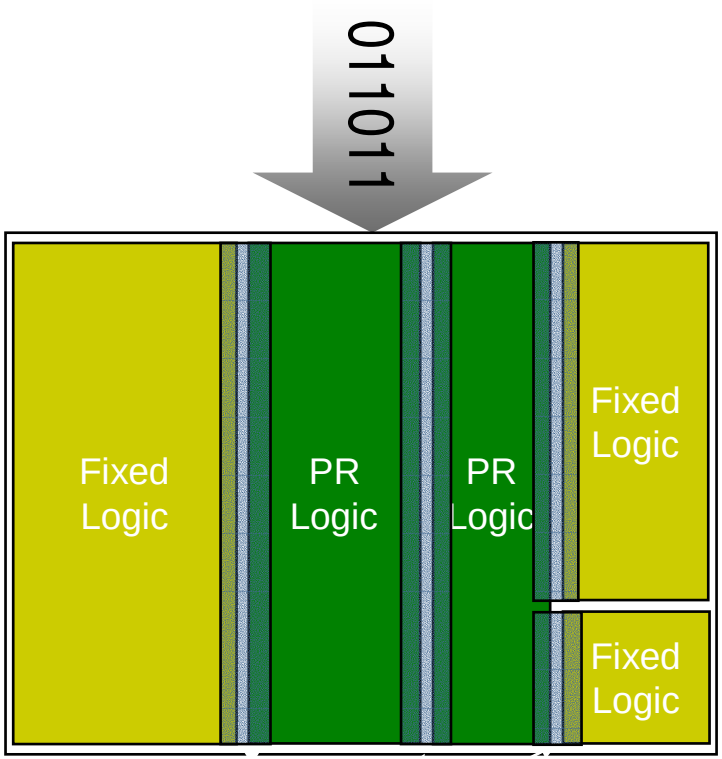
Self Reconfiguration Under LINUX



Partial Reconfigurability

FPGA Flexibility for the Field

- Re-program part of an FPGA while it's still running



JBits 3.0 for Virtex II is available (FOC)

Xilinx
Press Release #0396

FOR IMMEDIATE RELEASE

XILINX ENABLES RECONFIGURABLE COMPUTING WITH FREE JBits SOFTWARE FOR USE WITH VIRTEX-II FPGAS

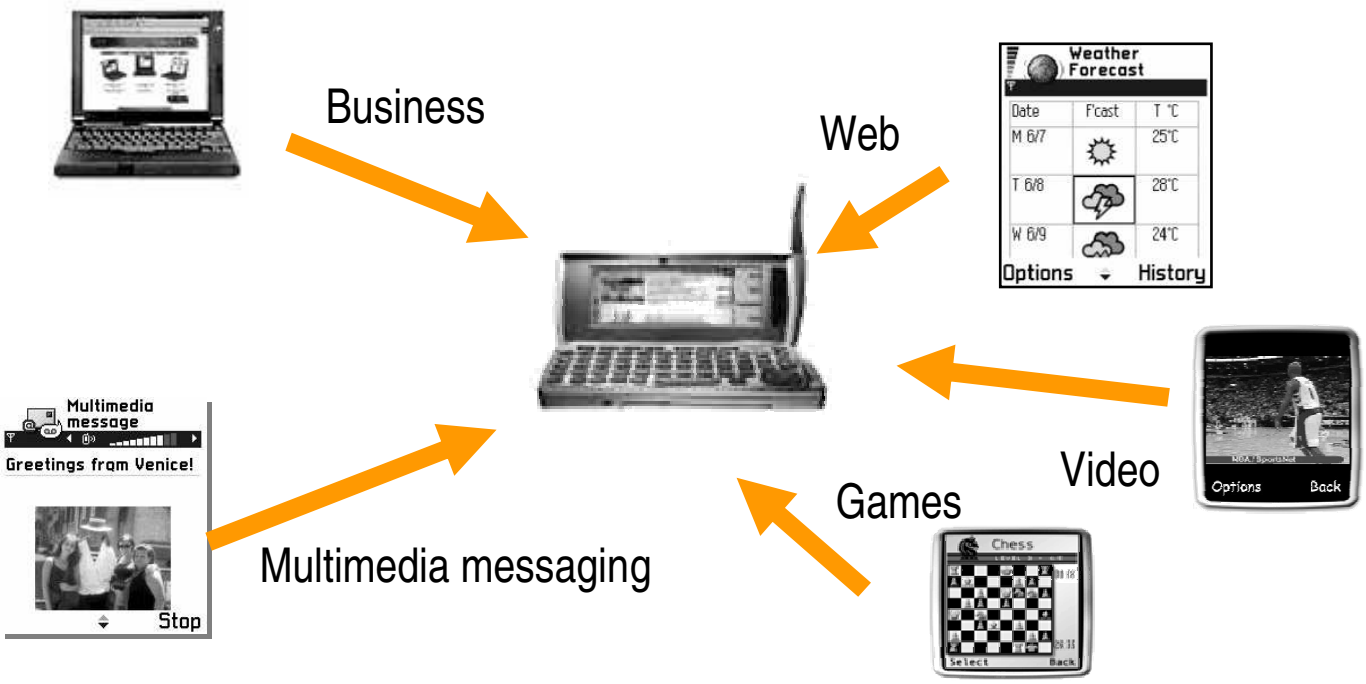
New software from Xilinx Research Labs enables Run-time Reconfiguration

SAN JOSE, Calif., August 5, 2003-Xilinx Inc. (NASDAQ: XLNX) today announced the immediate availability of JBits 3.0 software with support for its leading Virtex-II line of FPGAs. The new software is available at no charge and can be easily downloaded from the Xilinx website at www.xilinx.com/labs/projects/jbits/. By making JBits 3.0 support for Virtex-II available to researchers and developers in reconfigurable computing, Xilinx continues its tradition of supporting R&D into applications and design tools for reconfigurable computing.

The JBits Application Programming Interface (API) is implemented in the Java programming language and permits programmatic access to all of the configurable elements in Xilinx Virtex-II FPGAs. JBits 3.0 complements Xilinx's industry leading ISE software tools and enables the design and generation of partial bitstreams for reconfigurable applications. A state-of-the-art design, Reconfigurable Crossbar Switch was successfully developed using the combination of ISE and JBits 3.0 software tools. Visit www.xilinx.com/prs_rls/end_markets/02151crossbar.htm for additional information on the Crossbar Switch.

Market requirements

A mass market for one person…



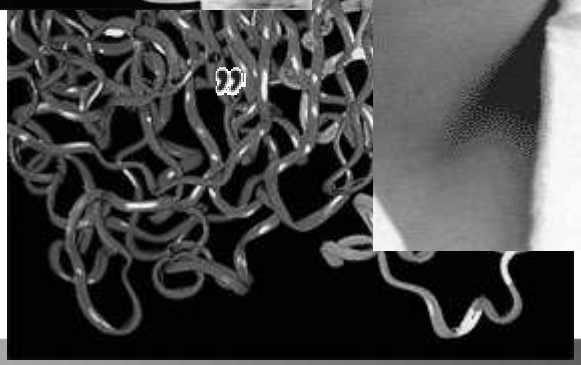
▶ **FPGA is reconfigurable**

Technology That Will Change People's Lives

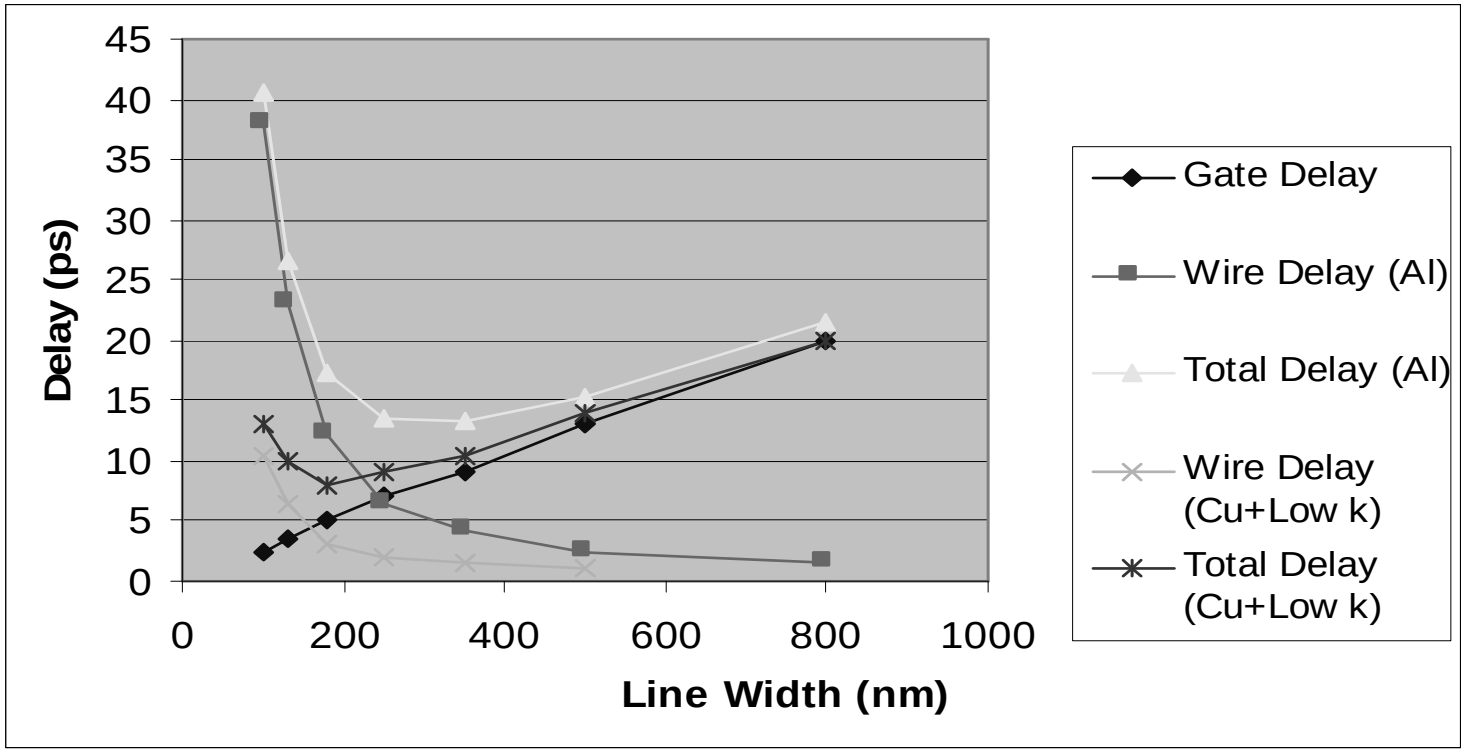
Top Technologies That Will Change Our Lives –
Field programmable "chameleon chips" ranked #1.
Ahead of cloning!

BusinessWeek 50: Masters of Innovation, April 7, 2001

#1 Chameleon chips
#2 Custom Kids
#3 Protein maps
#4 Fractal models
#5 Off-planet production
#6 Nanotechnology
#7 Virtual reality
#8 HIV Antivirals
#9 Optical computing
#10 Ambient Intelligence

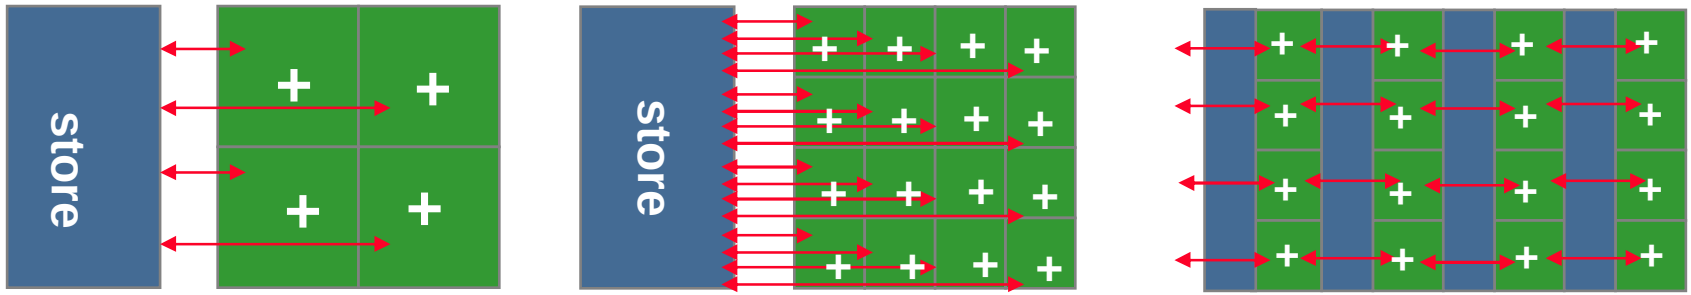


Performance Scaling



Source: ITRS

Architecture Requirements



λ λ/2 λ/2

Best design practice to benefit from Moore's Law

- Regular architecture
- Parallel architecture
- Highly testable
- Distributed memory
- Highly pipelined

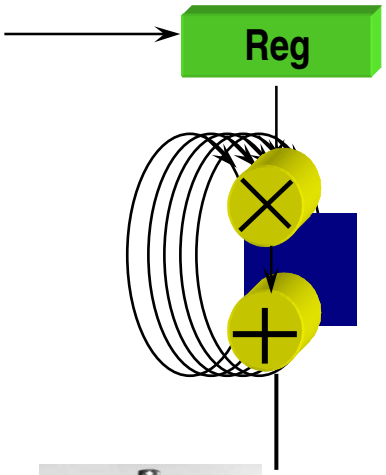
Heat/area V^3/λ^3

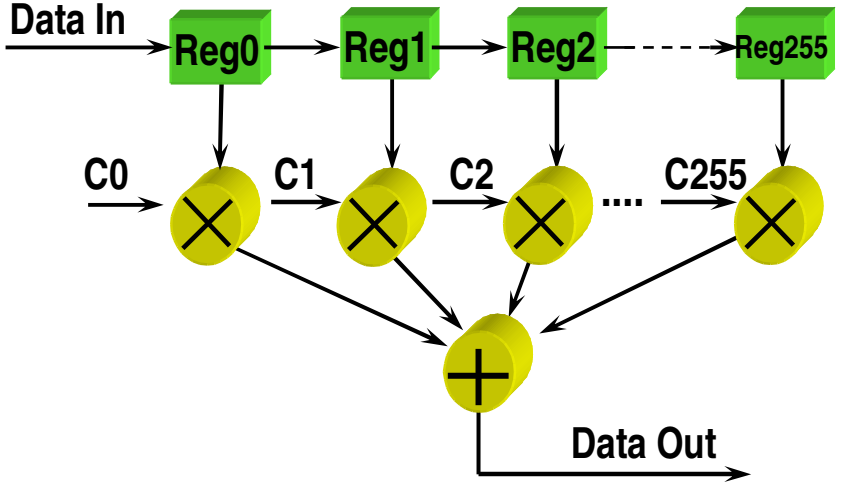
Interconnect Delay $\rho.l^2/\lambda^2$

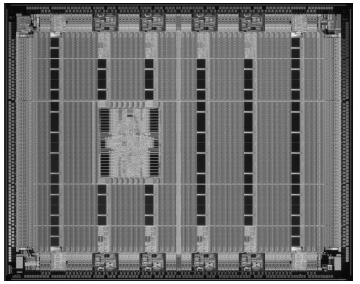
FPGA is future proof

Performance requirements

From sequential to spatial computing







► FPGA provides highest MOPS/Watt/$

Alternative Architectures…

- Cell based design
  - Deep submicron ends ‘composability’ of design
- Processors
  - Not scalable because of data transfer bottleneck
- Application Specific Standard Products (ASSP)
  - Bull’s eye market
- ‘Structured’ ASICs
  - Worst of both worlds

Conclusions

- Today : FPGA's ride the tide of Moore's Law
- Future proof architecture
- Opportunities :
  - Programmable System Platform
  - DSP
- Challenges
  - Low Power
  - Design technology
  - Use model to exploit time dimension
