

Mobile Agent Middleware for Sensor Networks: An Application Case Study

Agilla Middleware

- Mobile agents increase a network's flexibility
 - Proactively moves and clones across nodes
 - Adapts to unexpected circumstances
 - New agents can always be injected
- Middleware simplifies development providing
 - a high-level agent abstraction and language
 - context discovery
 - multi-hop geographic forwarding

Agent Architecture

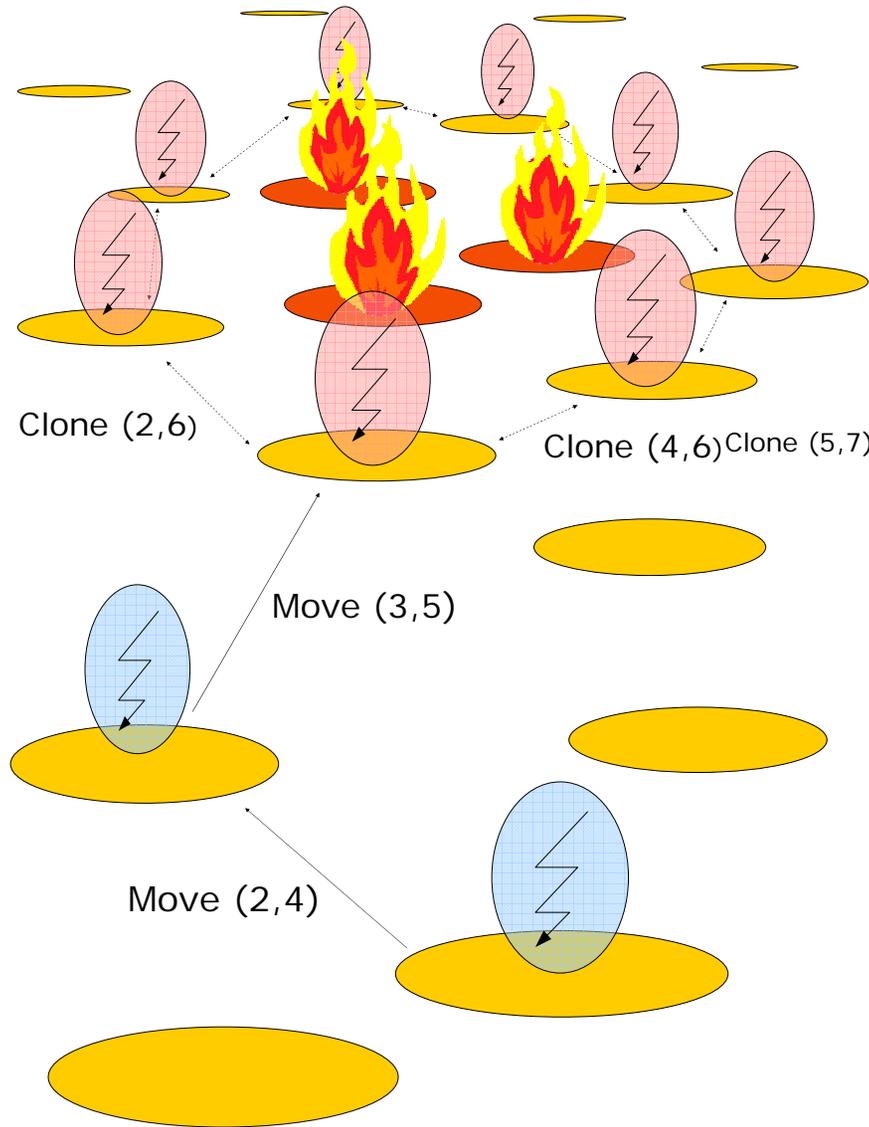

Stack	16-Bit Registers	Heap
Pointer	ID	0 32-bit
0 8-bit	PC	1
1	Condition	11
ri		

Stack-based to reduce code size

Agilla Programming Language

```

1: BEGIN    pushn fir
2:          pushc 1
3:          out // insert fire tuple
4: BLINK    pushc 25
5:          putled // toggle red LED
6:          pushc 1
7:          sl eep
8:          rj ump BLINK
    
```

Mobile agents swarm around a fire forming a perimeter

Fire Tracking using Mobile Agents

- Initially patrol the network looking for fire (fire encoded by a tuple in the tuple space)
- Upon finding fire, enter tracking mode
 - periodically check status of neighbors
 - clone to all neighbors in fire's vicinity
 - die if its node catches on fire

Experimental Setup

5x5 network of Mica2 Motes

Experimental Results

Static Fire Tests: Percent Perimeter Formation vs. Time

Percent Perimeter Formation Over Time Using Dynamic Fire

Static Fire

Epidemically Spreading Fire
